	No.2367B	<b>LC6512A, 6513A</b>
	<b>SINGLE-CHIP 4-BIT MICROCOMPUTER FOR CONTROL-ORIENTED APPLICATIONS (LOW-THRESHOLD INPUT, ON-CHIP FLT DRIVER)</b>	

### General Description

The LC6512A, 6513A are microcomputers that are identical with FLT driver-contained microcomputers LC6502D, 6505D in instruction set but are further enhanced in performance, such as shorter cycle time, more stack levels, increased FLT drive capacity, and are partially changed in specifications for standby function. Since the LC6512A, 6513A are also pin-compatible with the LC6502D, 6505D, they can be used as similar replacements for the LC6502D, 6505D. The LC6512A, 6513A can replace the LC6502B/6502D, 6505B/6505D to enhance performances of equipment in which these microcomputers have been applied so far.

### Features

- Low power dissipation CMOS single-chip microcomputer
- Instruction set with 79 instructions common to the LC6502C, 6502B, 6502D/LC6505C, 6505B, 6505D
- 2-source, 2-level interrupt function (external interrupt/internal timer interrupt)
- 8-level stack
- 4-bit prescaler-contained 8-bit programmable timer
- FLT driver-contained output ports and low-threshold input ports
  - (1) Digits driving output ports: 10 pins
  - (2) Segments driving output ports: 8 pins
  - (3) Normal voltage input ports: 8 pins (4 pins: Low-threshold input port)
  - (4) Normal voltage input/output ports: 8-pins
- ROM, RAM
  - (1) LC6512A ROM: 2048 bytes, RAM: 128 x 4 bits
  - (2) LC6513A ROM: 1024 bytes, RAM: 64 x 4 bits
- Cycle time 1.33 $\mu$ s min.  
400kHz, 800kHz, 1MHz, 3MHz ceramic resonator OSC
- Power-down by 2 standby modes
  - (1) HALT mode: Power dissipation saving by program standby during normal operation
  - (2) HOLD mode: Power supply backup during power failure
  - (3) The standby function is the same as for the LC6514B and its using method is different from that of the LC6502D, 6505D, etc.
- Differences among LC6512D, 6513D, and LC6512A, 6513A  
The LC6512D, 6513D and LC6512A, 6513A are different in the OSC circuit only and are the same in the basic features. The differences are shown below.

Item	LC6512A, 6513A	LC6512D, 6513D
OSC circuit configuration	1-stage inverter	5-stage inverter
OSC mode	Ceramic resonator OSC	Ceramic resonator OSC, CR OSC, application of external clock
OSC waveform	Sine wave	Rectangular wave
Operating frequency	Ceramic resonator OSC: 500kHz, 800kHz, 1MHz, 3MHz	Ceramic resonator OSC: 400kHz, 800kHz, 1MHz CR OSC: 400kHz typ, 800kHz typ External clock: 222kHz to 1290kHz

### Technical Data

The LC6512A, 6513A are members of our LC6500 series of CMOS microcomputers. For their internal functions, refer to the LC6500 SERIES USER'S MANUAL. Those which differ from the description in the USER'S MANUAL are described in this catalog. Carefully study features and Appendix 4 Standby Function in this catalog before using the LC6512A, 6513A.

**Package Dimensions 3025B-D42SIC**  
(unit: mm)

**Package Dimensions 3052A-Q48AIC**  
(unit: mm)

**Pin Assignment**

**Pin Name**

OSC1, OSC2 : Ceramic resonator for OSC

INT : Interrupt

RES : Reset

HOLD : Hold

PA0-3 : Input port A0-3

PB0-3 : Input port B0-3

PC0-3 : Input/output common port C0-3

PD0-3 : Input/output common port D0-3

PE0-3 : Output port (High-voltage port) E0-3

PF0-3 : Output port (High-voltage port) F0-3

PG0-3 : Output port (High-voltage port) G0-3

PH0-3 : Output port (High-voltage port) H0-3

PI0, 1 : Output port (High-voltage port) IO, 1

TEST : Test

**DIP42S**

**QIP48**

(Note) Nothing must be connected to NC pins internally or externally.

When mounting the QIP version on the board, do not dip it in solder.

System Block Diagram

| E   | : E register                | CF, CSF | : Carry flag, carry save flag     |
| CTL | : Control register          | ZF, ZSF | : Zero flag, zero save flag       |
| OSC | : Oscillation circuit       | EXTF    | : External interrupt request flag |
| TM  | : Timer                     | TMF     | : Internal interrupt request flag |

Pin Description

Pin Name	Input/Output	Function
$\overline{\text{INT}}$	Input	Interrupt request input pin
$\overline{\text{HOLD}}$	Input	HOLD mode request input pin (The LC6502, 6505 differ in function.) Capable of being used as a general-purpose single-bit input port unless the standby mode is used.
$\overline{\text{RES}}$	Input	Reset input pin
PA0-3	Input	Input port A0 to A3 (Normal voltage, low-threshold input) Capable of 4-bit input and single-bit decision for branch Use also for HALT mode release request input

(Continued on next page)

LC6512A, 6513A

(Continued from preceding page.)

PB <sub>0-3</sub>	Input	Input port B <sub>0</sub> to B <sub>3</sub> (Normal voltage) Capable of 4-bit input and single-bit decision for branch
PC <sub>0-3</sub>	Input/Output	Input/output common port C <sub>0</sub> to C <sub>3</sub> (Normal voltage) Capable of 4-bit input and single-bit decision for branch during input Capable of 4-bit output and single-bit set/reset during output
PD <sub>0-3</sub>	Input/Output	Input/output common port D <sub>0</sub> to D <sub>3</sub> (Normal voltage) Capable of 4-bit input and single-bit decision for branch during input Capable of 4-bit output and single-bit set/reset during output
PE <sub>0-3</sub>	Output	Output port E <sub>0</sub> to E <sub>3</sub> (Digit driver output) Capable of 4-bit output and single-bit set/reset Capable of 4-bit input of output latch contents and single-bit decision of output latch for branch
PF <sub>0-3</sub>	Output	Output port F <sub>0</sub> to F <sub>3</sub> (Digit driver output) Capable of 4-bit output and single-bit set/reset Capable of 4-bit input of output latch contents and single-bit decision of output latch for branch
PG <sub>0-3</sub>	Output	Output port G <sub>0</sub> to G <sub>3</sub> (Segment driver output) Capable of 4-bit output and single-bit set/reset Capable of 4-bit input of output latch contents and single-bit decision of output latch for branch
PH <sub>0-3</sub>	Output	Output port H <sub>0</sub> to H <sub>3</sub> (Segment driver output) Capable of 4-bit output and single-bit set/reset Capable of 4-bit input of output latch contents and single-bit decision of output latch for branch
PI <sub>0, 1</sub>	Output	Output port I <sub>0</sub> , I <sub>1</sub> (Digit driver output) Capable of 2-bit output and single-bit set/reset Capable of 2-bit input of output latch contents and single-bit decision of output latch for branch
OSC1	Input	A ceramic resonator is connected to this pin and pin OSC2 in the internal clock mode.
OSC2	Output	Pin for externally connecting a resonance circuit for the internal clock mode
VDD	Input	Power supply pin Normally connected to +5V
VSS	—	Connected to 0V power supply
TEST	Input	LSI test pin Normally connected to VSS(0V)

**Absolute Maximum Ratings/T<sub>a</sub> = 25°C, V<sub>SS</sub> = 0V**

				unit
Maximum Supply Voltage	VDD		-0.3 to +7.0	V
Input Voltage	VIN	Input pins other than OSC1	-0.3 to VDD+0.3(Note1)	V
Output Voltage	VOUT(1)	Ports C, D OSC 2	-0.3 to VDD+0.3	V
	VOUT(2)	Ports E, F, G, H, I	VDD-45 to VDD+0.3	V
Peak Output Current	IO(1)	Ports C, D: Each pin	-2.0 to +2.0	mA
	IO(2)	Ports E, F, I: Each pin	-15 to 0	mA
	IO(3)	Ports G, H: Each pin	-10 to 0	mA
	IO(4)	All pins of ports C to I	-90 to +16	mA
Allowable Power Dissipation	Pd max(1)	T <sub>a</sub> =-30 to +70°C(Flat package)	350	mW
	Pd max(2)	T <sub>a</sub> =-30 to +70°C (DIP)	600	mW
Operating Temperature	Topr		-30 to +70	°C
Storage Temperature	Tstg		-55 to +125	°C

(Note 1) For pin OSC1, up to oscillation amplitude generated when internally oscillated under the recommended oscillation conditions in Fig. 2 is allowable.

[ Note ] When mounting the QIP package version on the board, do not dip it in solder.

Allowable Operating Conditions/ $T_a = -30$ to $+70^\circ\text{C}$ , $V_{DD} = 5V \pm 10\%$ , $V_{SS} = 0V$		min	typ	max	unit
Operating Supply Voltage	$V_{DD}(1)$	4.5	5.0	5.5	V
Power-down Supply Voltage	$V_{DD}(2)$	1.8		5.5	V
"H"-Level Input Voltage	$V_{IH}(1)$	Port A		$V_{DD}$	V
	$V_{IH}(2)$	Ports B, C, D		$0.7V_{DD}$	V
	$V_{IH}(3)$	$\overline{INT}$ , $\overline{RES}$ , $\overline{HOLD}$ and OSC1		$0.8V_{DD}$	V
	$V_{IH}(4)$	Port A		$V_{SS}$	V
"L"-Level Input Voltage	$V_{IL}(1)$	Ports B, C, D		$0.3V_{DD}$	V
	$V_{IL}(2)$	$\overline{INT}$ , $\overline{RES}$ , OSC1		$V_{SS}$	V
	$V_{IL}(3)$	$\overline{HOLD}$ , TEST: $V_{DD}=1.8$ to $5.5V$		$0.2V_{DD}$	V
	$V_{IL}(4)$	Port A		$V_{SS}$	V
External Capacitance for Ceramic Resonator OSC	C1	See Fig. 2.			
	C2	See Fig. 2.			
Allowable Delay in Key Scan Circuit	$t_{DH}$	See Figs. 3-3, 3-4 in Appendix 3.		$(N-2) X_{tcyc}$	$\mu s$
	$t_{DL}$			$(N-2) X_{tcyc}$	$\mu s$
Standby Timing	$t_{VDDF}$	$V_{DD}=1.8$ to $5.5V$ , See Fig. 1.		0	$\mu s$
	$t_{VDDR}$	$V_{DD}=1.8$ to $5.5V$ , See Fig. 1.		0	$\mu s$

(Note)  $t_{cyc}$ : Cycle time at microcomputer running mode

[ Note ]  
No chattering shall be applied to the  $\overline{HOLD}$  pin and PA0 to 3 pins during the HALT instruction execution cycle.

Fig. 2 Recommended OSC circuit, constants for ceramic resonator OSC

Note 2) There is a tolerance of approximately 1% between the center frequency at the ceramic resonator mode and the nominal value presented by the ceramic resonator supplier. For details, refer to the specification for the ceramic resonator.  
 The min., max. values of OSC frequency represent the oscillatable frequency range.

Note 3) When using the piggyback microcomputer, evaluation chip for evaluation, connect a feedback resistor (approximately 1Mohm).

Input/output common ports C, D: Output inhibit HALT instruction is executed to provide HALT mode.

Fig. 3 IDD(2) test circuit

Fig. 4 IDD(3) test circuit

$\tau_{VDD}$ : Power supply rise time constant  
 $\tau_{RES}$ : RES pin rise time constant  
 Fix C, R so that  $\tau_{VDD} \leq \tau_{RES}$ ,  $t_{OSC} \geq 10\text{msec}$ . is obtained.  
 $t_{OSC}$ : OSC stabilized time

Fig. 5 Initial reset timing

**Appendix 1. Support System**

For application development of the LC6512A, 6513A, the support system for the LC6512A, 6513A is used.

**1-1. Software support**

The support system provides source editor, cross assembler. For cross assembler on CP/M, the "LC6502.COM", "LC6505.COM" are used, and on MS-DOS, the "LC6512.COM", "LC6513.COM" are used.

**1-2. Hardware support**

**(1) Evaluation chip**

Evaluation chip LC6597 is used. Level converters, drivers are connected to high-voltage ports (PE<sub>0</sub> to 3, PF<sub>0</sub> to 3, PG<sub>0</sub> to 3, PH<sub>0</sub> to 3, PI<sub>0, 1</sub>) externally.

(A dedicated adaptor is available.)

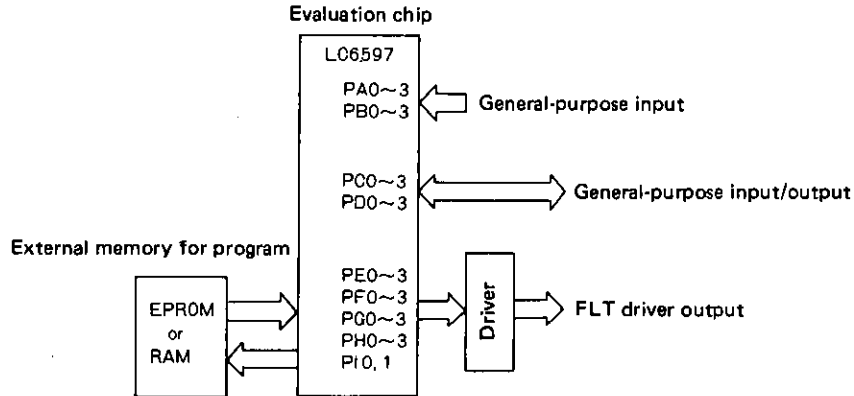

Fig. 1-1 Basic evaluation system using evaluation chip

**(2) Simulation chip**

Piggyback LC65PG12/13 and adaptor (EVA-97-12D/13D) for the LC6512A, 6513A are used jointly.

Fig. 1-2 How to use piggyback

(3) Evaluation kit

The EVA-410 and EVA-TB2 are used. For connecting with user's application equipment, adaptor (EVA-97-12D/13D) is used.

(4) Adaptor (EVA-97-12D/13D)

This is used when evaluating the LC6512A, 6513A with the aid of the evaluation chip and piggyback. This contains drivers for FLT. (See Figs. 1-3, 1-4.)

Fig. 1-3 Adaptor (EVA-97-12D/13D) for LC6512A, 6513A

Fig. 1-4 EVA-97-12D/13D

**Appendix 2. Internal Architecture of LC6512A, 6513A**

The LC6512A, 6513A are identical with the LC6502C, 6505C in the internal architecture and instruction set except that output ports are of high-voltage type and port A is of low-threshold input type and the standby function is the same as for the LC6514B. For details, refer to "LC6500 SERIES USER'S MANUAL"; and for the standby function, refer to Appendix 4 "Standby Function".

**2-1. PC**

For the LC6512A, 6513A, this is organized with a 11-bit, 10-bit binary counter, respectively, which specifies the ROM address of an instruction to be executed next. The high-order 3(2) bits specify a page and the low-order 8 bits specify an address in the page. The page is updated automatically. ( ) is for the LC6513A.

**2-2. ROM**

This is used to store user programs. For the LC6512A, 6513A, this is organized with 2048 x 8 bits, 1024 x 8 bits, respectively. By using the ROM table read instruction, the whole area can be accessed and the display pattern can be programmed.

**2-3. Stack**

This is used to save the contents of the PC at the subroutine call or interrupt mode. This allows subroutine nesting up to 8 levels.

**2-4. DP**

This is a register organized with 4-bit DPL and 3-bit, 2-bit DPH for the LC6512A, 6513A, respectively. When accessing the data RAM, the DPL, DPH specify a column address, row address, respectively. When accessing input/output ports, the DPL specifies port A to port I. The DPL also specifies internal pseudo port O.

**2-5. RAM**

This is a static RAM used to store data. For the LC6512A, 6513A, this is organized with 128 x 4 bits, 64 x 4 bits, respectively. Row address 7H(3H) is allocated for 16 flags and 8 working registers which can be manipulated without being addressed by the DP. ( ) is for the LC6513A.

**2-6. AC, E**

The AC is a 4-bit register which stores data to be processed by instructions. The E register is an auxiliary register to be back up the AC and is used as a temporary register or general-purpose register at the instruction execution mode.

**2-7. ALU**

This is a circuit which performs arithmetic and logic operations specified by individual instructions. This outputs not only data of operation results but also the status of carry (C), zero (Z).

**2-8. Status register**

This is a 4-bit register which stores the status of carry, zero and the external interrupt, timer interrupt request. The contents of the status register can be tested by the branch instructions.

**2-9. Timer**

This consists of a 4-bit fixed prescaler and a 8-bit programmable timer. This counts the system clock and requests a timer interrupt when an overflow occurs.

**2-10. Control register**

This is a 4-bit register, 2-bits of which control input/output of input/output common ports C, D and 2-bits of which enable/disable external interrupt, internal timer interrupt.

**2-11. Input/output ports**

There are 9 ports/34 pins from port A to I. Each port is addressed by the DPL. Ports A, B are of normal-voltage input type, ports C, D are of normal-voltage input/output common type, and ports E, F, G, H, I contain FLT drivers. Port A is of low-threshold input type.

(1) Ports A<sub>0</sub> to 3, B<sub>0</sub> to 3

- Functions
- 4-bit input (IP instruction)
  - Single-bit test (BP, BNP instructions)
  - Port A: Low-threshold input
  - Port B: Normal-threshold input

(2) Ports C<sub>0</sub> to 3, D<sub>0</sub> to 3

- Functions
1. Input mode (Output inhibit)
    - 4-bit input (IP instruction)
    - Single-bit test (BP, BNP instructions)
  2. Output mode
    - 4-bit output (OP instruction)
    - Single-bit set, reset (SPB, RPB instructions)

(3) Ports E<sub>0</sub> to 3, F<sub>0</sub> to 3, G<sub>0</sub> to 3, H<sub>0</sub> to 3, I<sub>0</sub> to 1 (High-voltage ports)

- Functions
- 4-bit (2-bit for port I) output (OP instruction)
  - 4-bit (2-bit for port I) input of output latch contents (IP instruction)
  - Single-bit set, reset (SPB, RPB instructions)
    - Set: The output represents a 1. ----- Output transistor ON
    - Reset: The output represents a 0. ----- Output transistor OFF
  - Single-bit test of output latch contents (BP, BNP instructions)
  - Ports E, F, I: FLT digits drive
  - Ports G, H: FLT segments drive

2-12. External interrupt

The trailing edge of the signal on the  $\overline{\text{INT}}$  pin is detected and the interrupt request flag in the status register is set. The occurrence of an interrupt is controlled by the enable/disable flag in the control register.

2-13. Reset

The system is initialized by setting the  $\overline{\text{RES}}$  pin to "L" level. The contents to be initialized are as follows:

- PC                      Address 000H
- Control register    0000 → Interrupt disable, Ports C, D: Output inhibit
- Status register     Timer, external interrupt flag → Reset
- Output port         Output latch (0H) → Output transistor OFF

Appendix 3. Proper Cares in Using LSI

3-1. Low-threshold input port A<sub>0</sub> to 3 provides the input characteristic shown in Fig. 3-1.

Fig. 3-1

3-2. FLT driver output

Ports E<sub>0</sub> to 3, F<sub>0</sub> to 3, I<sub>0</sub> to 1 (10 pins) are for high-current digits driver output; and ports G<sub>0</sub> to 3, H<sub>0</sub> to 3 (8 pins) are for intermediate-current segments driver outputs. Of course, digits driver outputs can be used as segments driver outputs. Fig. 3-2 shows a sample application.

Fig. 3-2 FLT display application

**Digit drive signal-used key scan**

When key-scanning with the FLT digit drive signal in Fig. 3-3 and inputting the return signal to port A, the following must be observed.

- (a) Estimate voltage drop ( $V_{ON}$ ) in the output transistor using the current flowing in an FLT used and the V-I characteristic of the output port of the LC6512A, 6513A.
- (b) Estimate voltage drop ( $V_{SW}$ ) in the switch circuit.
- (c) Check to see that  $V_{ON} + V_{SW}$  meets the  $V_{IH}/V_{IL}$  requirement of the input port in Fig. 3-1.

Fig. 3-3 Sample key scan application

For the key scan application in Fig. 3-3, make the program considering the delay in the external circuit and the input delay shown below.

Fig. 3-4

When the IP instruction is used to input the return signal as shown above, the input delay must be considered and two instructions are placed between the IP instruction and the crossing of input port waveform and  $V_{IL}(4)$ ,  $V_{IH}(1)$ , respectively. Some instructions must be placed additionally according to the length of delay ( $t_{DL}$ ,  $t_{DH}$ ) in the external circuit after the digit drive signal is delivered with the execution of the OP instruction (point a and point c).

N: Number of instruction cycles existing between instruction (OP, SPB, RPB) used to output data to output port and instruction (IP, BP, BNP) used to input data from input port.

(Number of instruction cycles to be programmed according to the length of  $t_{DL}$ ,  $t_{DH}$ )

$t_{DL}$ ,  $t_{DH}$ : Delay in external circuit from output port to input port.

#### Appendix 4. Standby Function

Two standby modes — HALT mode and HOLD mode — are available to minimize the power dissipation when the program is in the wait state or a power failure is backed up. Both modes are set with the execution of the HALT instruction. All the operations including the system clock generator are stopped at the standby mode. (For other models LC6502/05 of the LC6500 series, the HOLD mode is hardware-set with the  $\overline{\text{HOLD}}$  pin = "L". Be careful of the difference in the mode setting method.)

The HALT mode and HOLD mode are used properly depending on the purposes. They are different in the mode setting conditions, I/O port state during standby operation, mode releasing method. The HALT mode is entered by executing the HALT instruction when the  $\overline{\text{HOLD}}$  pin is at "H" level. The HALT mode is used to save the power dissipation when the program is in the wait state. The HOLD mode is entered by executing the HALT instruction when the  $\overline{\text{HOLD}}$  pin is at "L" level. At the HOLD mode all I/O ports are disabled and there is no power dissipation in the interfaces with external circuits, permitting capacitor or battery-used power supply backup during power failure.

##### 4-1. HALT mode setting

The HALT mode is entered by executing the HALT instruction when the  $\overline{\text{HOLD}}$  pin is at "H" level and all pins for port A<sub>0</sub> to A<sub>3</sub> are at "L" level. When even one of pins for port A<sub>0</sub> to A<sub>3</sub> is at "H" level, the HALT instruction is disregarded and becomes equal to the NOP instruction.

The HALT mode causes individual blocks to be placed in the following states.

- (1) Operation is stopped
  - All the operations including the system clock generator are stopped.
- (2) I/O port
  - The state immediately before setting the HALT mode is held.
- (3) Blocks to be cleared/reset
  - Timer . . . . . State where all bits are set to "1" (max. time).
  - Status flag . . . . . The EXTF, TMF are reset (interrupt disable). The CF, ZF contents are held. An interrupt request at the HALT mode is disregarded.
- (4) Blocks to be held
  - For the registers, data RAM, port output latch, PC (except those in (3), the contents immediately before setting the HALT mode are held.

##### 4-2. HOLD mode setting

The HOLD mode is entered by executing the HALT instruction when the  $\overline{\text{HOLD}}$  pin is at "L" level. In this case, the contents of port A<sub>0</sub> to A<sub>3</sub> remain unaffected.

The state in the HOLD mode is the same as that in the HALT mode, except the state of I/O port. The HOLD mode permits the undermentioned power-down mode to be entered.

##### I/O port

- Input ports A, B:           Input inhibit
- Input/output port C, D:   Input inhibit, output high impedance
- Output ports E to I:       Output Pch transistor OFF
- INT, RES pins:            Input inhibit

For the output latch of the output port, the contents immediately before setting the HOLD mode are held.

### 4-3. HOLD power-down mode setting

The HOLD mode permits the supply voltage to be lowered and also the power dissipation to be reduced after mode setting. The HOLD mode can be used in the capacitor or battery-used backup operation during power failure.

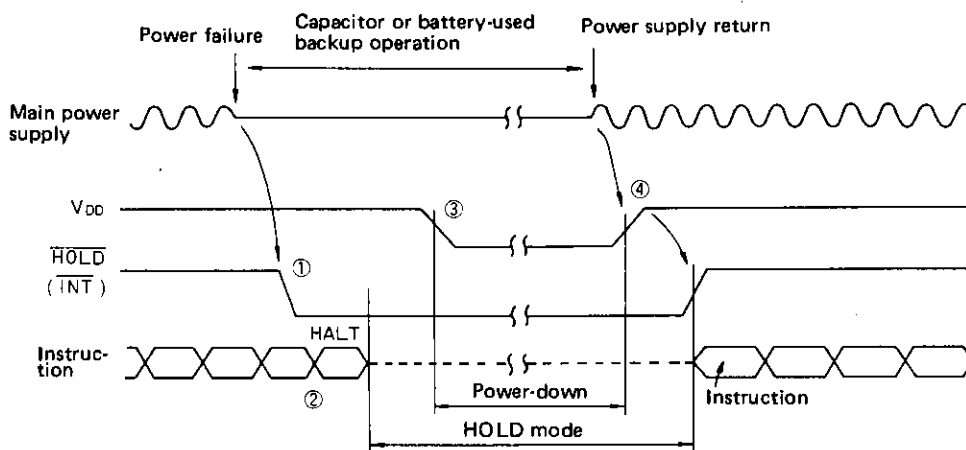

Fig. 4-1 HOLD mode and power-down

- ① A failure of the main power supply is detected and a standby request is made. This is hardware-controlled by the external circuit.
- ② The  $\overline{\text{HOLD}}$  pin is software-pollled or the same signal is applied to the  $\overline{\text{INT}}$  pin to test the standby request by interrupt. Then, the HALT instruction is executed and the HOLD mode is entered. (Note)
- ③ After the HOLD mode is entered, power-down can be attained by lowering  $V_{DD}$ .
- ④ After  $V_{DD}$  returns to the prescribed voltage, the  $\overline{\text{HOLD}}$  pin is set to "H" level and the normal operation returns.

(Note) The  $\overline{\text{HOLD}}$  pin input signal is transferred to pseudo input port PO 0 (DPL = 0EH,  $2^0$  bit). Therefore, when polling the  $\overline{\text{HOLD}}$  pin, the BPO or BNPO instruction is used at DPL = 0EH. (The IP instruction cannot be used.)

When the BPO instruction is used for testing, a branch occurs when the input voltage is at high level in the same manner as for normal input ports.

### 4-4. HALT mode release

#### Release by reset

When "L" level is applied to the RES pin, the HALT mode is released and the system reset state is entered.

When the RES pin is set to "H" level again, the normal operation starts. Since the ceramic resonator mode is used for system clock generation, the release by reset must be performed.

— Notes —

- Since the ceramic resonator mode is used for system clock generation, "L" level must be applied to the  $\overline{\text{RES}}$  pin for 5 to 10 msec (oscillation stabilizing time).

#### Mode change from HALT mode to HOLD Mode

The HALT mode is entered with the execution of the HALT instruction when the  $\overline{\text{HOLD}}$  pin is at "H" level.

The HALT mode is changed to the HOLD mode automatically by setting the  $\overline{\text{HOLD}}$  pin to "L" level.

Fig. 4-2 Mode change from HALT mode to HOLD mode

4-5. HOLD mode release

Release by reset

The HOLD mode is released by setting the  $\overline{\text{HOLD}}$  pin to "H" level while applying "L" level to the  $\overline{\text{RES}}$  pin. When the  $\overline{\text{RES}}$  pin is set to "H" level again, the normal operation starts. The contents of the memories remain unaffected except the PC, I/O ports, registers which are initialized by the reset operation.

Since the ceramic resonator mode is used, the reset state must be held until oscillation is fully stabilized (10 msec after oscillation start) after the HOLD mode is released.

Fig. 4-3 HOLD mode release by reset

Note: With "L" level applied to the  $\overline{\text{HOLD}}$  pin as shown above, the CPU is not reset even when the  $\overline{\text{RES}}$  pin is set to "L" level. This is because the  $\overline{\text{HOLD}}$  pin is given priority lest the CPU is reset unnecessarily when the capacitor or battery-used backup mode causes the CPU peripherals to operate unstably and the  $\overline{\text{RES}}$  pin is set to "L" level. Be careful of the level of the  $\overline{\text{HOLD}}$  pin and  $\overline{\text{RES}}$  pin also at the initial reset mode when power is applied. When the  $\overline{\text{HOLD}}$  pin is at "L" level, no reset occurs.

4-6. Proper cares in using standby function

When using the HOLD mode, an application circuit and program must be designed with the following in mind.

- (1) The supply voltage at the standby state must not be less than specified.
- (2) Input timing of each control signal (HOLD, RES, port A, INT, etc.) at the standby initiate/release state.
- (3) Release operation must not be overlapped at the time of execution of the HALT instruction.

4-7. Sample application where the standby function is used for power failure backup

Power failure backup is an application where power failure of the main power source is detected by the  $\overline{\text{HOLD}}$  pin, etc. to cause the HOLD mode to be entered so that the current dissipation is minimized and a backup capacitor is used to retain the contents of the internal registers even during power failure.

4-7-1. Sample application circuit (ceramic resonator OSC)

Fig. 4-4 shows a ceramic resonator OSC-applied circuit where the standby function is used for power failure backup.

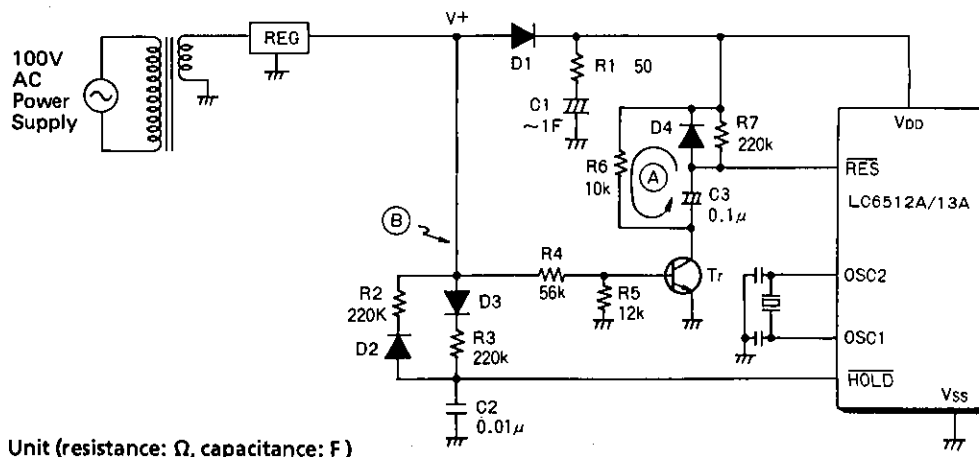

Fig. 4-4 Sample Application Circuit

4-7-2. Operating waveform

The operating waveform in the sample application circuit in Fig. 4-4 is shown below. The mode is roughly divided as follows:

4-7-3. Operation of sample application circuit

- ① At the time of initial application of power  
A reset occurs and the execution of the program starts at address 000H of the program counter (PC).
- ② At the time of instantaneous break
  - (1) At the time of very short instantaneous break  
The execution of the program continues.
  - (2) At the time of instantaneous break being a little longer than (1) (When the  $\overline{\text{RES}}$  input voltage meets  $V_{IL}$  and the  $\overline{\text{HOLD}}$  input voltage does not meet  $V_{IL}$ ).  
A reset occurs during the execution of the program and the execution of the program starts at address 000H of the program counter (PC).  
Since the HOLD request signal is not applied to the  $\overline{\text{HOLD}}$  pin, the HOLD mode is not entered.
  - (3) At the time of long instantaneous break (When both of the  $\overline{\text{RES}}$  input voltage and  $\overline{\text{HOLD}}$  input voltage meet  $V_{IL}$ ).  
The HOLD request signal is applied to the  $\overline{\text{HOLD}}$  pin and the HOLD mode is entered.  
When V+ rises after instantaneous break, a reset occurs to release the HOLD mode and the execution of the program starts at address 000H of the program counter (PC).
- ③ At the time of return from backup voltage  
A reset occurs and the execution of the program starts at address 000H of the program counter (PC).

4-7-4. Notes for circuit design

- ① How to fix C3, R6, C2, R2  
Fix closed loop (A) discharge time constants  $C3, R6$  and  $\overline{HOLD}$  pin charge time constants  $C2, R2$  so that closed loop (A) fully discharges before the  $\overline{HOLD}$  input voltage gets lower than  $V_{IL}$  at the time of instantaneous break and the  $\overline{RES}$  input voltage is sure to get lower than  $V_{IL}$  (a reset occurs) when  $V+$  rises after instantaneous break where the  $\overline{HOLD}$  input voltage gets lower than  $V_{IL}$ .
- ② How to fix C3, R7  
Fix  $\overline{RES}$  pin charge time constants  $C3, R7$  so that when power is applied initially or the  $\overline{HOLD}$  mode is released the ceramic resonator  $OSC$  oscillates normally and the  $\overline{RES}$  input voltage exceeds  $V_{IH}$  and the program starts running.
- ③ How to fix R4, R5  
Fix  $T_r$  bias constants  $R4, R5$  so that when  $V+$  rises after instantaneous break the  $\overline{RES}$  input voltage gets lower than  $V_{IL}$  (brought to "L" level) before the  $\overline{HOLD}$  input voltage exceeds  $V_{IH}$  (brought to "H" level).
- ④ How to fix C2, R3  
Fix  $\overline{HOLD}$  pin charge time constants  $C2, R3$  so that when the  $\overline{HOLD}$  mode is released from the backup mode the  $\overline{HOLD}$  input voltage does not exceed  $V_{OH}$  (not brought to "H" level) until the  $\overline{RES}$  input voltage gets lower than  $V_{IL}$  (brought to "L" level).  
Fix  $C3, R7$  and  $C2, R3$  so that the time interval from the moment the  $\overline{HOLD}$  input voltage exceeds  $V_{IH}$  until the moment the  $\overline{RES}$  input voltage exceeds  $V_{IH}$  is longer than the ceramic resonator  $OSC$  stabilizing time.
- ⑤ When the load is heavy or the polling interval is long  
Since  $C1$  discharges largely, increase the capacity of  $C1$  or separate (B) detection from  $V+$  and use a power supply or signal that rises faster than  $V+$ .

4-7-5. Notes for software design

When the  $\overline{HOLD}$  request signal is detected, the  $HALT$  instruction is executed immediately. A concrete example is shown below.

- (1) An interrupt is inhibited before polling the  $\overline{HOLD}$  request pin ( $\overline{HOLD}$  pin).
- (2) Polling of the  $\overline{HOLD}$  pin and the  $HALT$  instruction are programmed consecutively.

[ Concrete example ]

```

RCTL      3      ;EXTEN, TMEN ← 0 (External, timer interrupt inhibit)
BP0       AAA    ;Polling of the  $\overline{HOLD}$  pin (If "H" level, a branch occurs to AAA.)
HALT      ;The  $\overline{HOLD}$  mode is entered.
AAA:
    
```

	JPEA	Jump in the current page modified by E and AC	1 1 1 1	1 0 1 0	1	1	PC7 ~ 0 ← (E, AC)	A jump to an address specified by the contents of the PC whose low-order 8 bits are replaced with the E and AC contents occurs.		
	CZP addr	Call subroutine in the zero page	1 0 1 1	P3 P2 P1 P0	1	1	STACK ← (PC) + 1 PC11 ~ 5, PC1 ~ 0 ← 0 PC5 ~ 2 ← P3 P2 P1 P0	A subroutine in page 0 of bank 0 is called.		
	CAL addr	Call subroutine in the zero bank	1 0 1 0	1 P0 P9 P8 P7 P6 P5 P4	2	2	STACK ← (PC) + 2 PC11 ~ 0 ← 0 P0 P9 P8 P7 P6 P5 P4 P3 P2 P1 P0	A subroutine in bank 0 is called.		
	RT	Return from subroutine	0 1 1 0	0 0 1 0	1	1	PC ← (STACK)	A return from a subroutine occurs.		
	RTI	Return from interrupt routine	0 0 1 0	0 0 1 0	1	1	PC ← (STACK) CF ZF ← CSF, ZSF	A return from an interrupt servicing routine occurs.	ZF CF	
Branch instructions	BAt addr	Branch on AC bit	0 1 1 1	0 0 t1 t0 P7 P6 P5 P4 P3 P2 P1 P0	2	2	PC7 ~ 0 ← P7 P6 P5 P4 P3 P2 P1 P0 if AC1 = 1	If a single bit of the AC specified by immediate data t1t0 is 1, a branch to an address specified by immediate data P7 to P0 within the current page occurs.		Mnemonic is BNA0 to BA3 according to the value of t.
	BNAI addr	Branch on no AC bit	0 0 1 1	0 0 t1 t0 P7 P6 P5 P4 P3 P2 P1 P0	2	2	PC7 ~ 0 ← P7 P6 P5 P4 P3 P2 P1 P0 if AC1 = 0	If a single bit of the AC specified by immediate data t1t0 is 0, a branch to an address specified by immediate data P7 to P0 within the current page occurs.		Mnemonic is BNA0 to BNA3 according to the value of t.
	BMt addr	Branch on M bit	0 1 1 1	0 1 t1 t0 P7 P6 P5 P4 P3 P2 P1 P0	2	2	PC7 ~ 0 ← P7 P6 P5 P4 P3 P2 P1 P0 if (M(DP, t1 t0)) = 1	If a single bit of the M(DP) specified by immediate data t1t0 is 1, a branch to an address specified by immediate data P7 to P0 within the current page occurs.		Mnemonic is BM0 to BM3 according to the value of t.
	BNMt addr	Branch on no M bit	0 0 1 1	0 1 t1 t0 P7 P6 P5 P4 P3 P2 P1 P0	2	2	PC7 ~ 0 ← P7 P6 P5 P4 P3 P2 P1 P0 if (M(DP, t1 t0)) = 0	If a single bit of the M(DP) specified by immediate data t1t0 is 0, a branch to an address specified by immediate data P7 to P0 within the current page occurs.		Mnemonic is BNM0 to BNM3 according to the value of t.
	BPt addr	Branch on Port bit	0 1 1 1	1 0 t1 t0 P7 P6 P5 P4 P3 P2 P1 P0	2	2	PC7 ~ 0 ← P7 P6 P5 P4 P3 P2 P1 P0 if (P(DPL, t1 t0)) = 1	If a single bit of port P(DPL) specified by immediate data t1t0 is 1, a branch to an address specified by immediate data P7 to P0 within the current page occurs.		Mnemonic is BP0 to BP3 according to the value of t.
	BNP1 addr	Branch on no Port bit	0 0 1 1	1 0 t1 t0 P7 P6 P5 P4 P3 P2 P1 P0	2	2	PC7 ~ 0 ← P7 P6 P5 P4 P3 P2 P1 P0 if (P(DPL, t1 t0)) = 0	If a single bit of port P(DPL) specified by immediate data t1t0 is 0, a branch to an address specified by immediate data P7 to P0 within the current page occurs.		Mnemonic is BNP0 to BNP3 according to the value of t.
BTM addr	Branch on timer	0 1 1 1	1 1 0 0	2	2	PC7 ~ 0 ← P7 P6 P5 P4 P3 P2 P1 P0 if TMF = 1 then TMF ← 0	If the TMF is 1, a branch to an address specified by immediate data P7 to P0 within the current page occurs. The TMF is reset.	TMF

	BNZ addr	Branch on no ZF	0 0 1 1 P <sub>7</sub> P <sub>6</sub> P <sub>5</sub> P <sub>4</sub>	1 1 1 0 P <sub>3</sub> P <sub>2</sub> P <sub>1</sub> P <sub>0</sub>	2	2	PC <sub>7~0</sub> ← P <sub>7</sub> P <sub>6</sub> P <sub>5</sub> P <sub>4</sub> P <sub>3</sub> P <sub>2</sub> P <sub>1</sub> P <sub>0</sub> if ZF = 0	If the ZF is 0, a branch to an address specified by immediate data P <sub>7</sub> to P <sub>0</sub> within the current page occurs.		
	BF <sub>n</sub> addr	Branch on flag bit	1 1 0 1 P <sub>7</sub> P <sub>6</sub> P <sub>5</sub> P <sub>4</sub>	n <sub>3</sub> n <sub>2</sub> n <sub>1</sub> n <sub>0</sub> P <sub>3</sub> P <sub>2</sub> P <sub>1</sub> P <sub>0</sub>	2	2	PC <sub>7~0</sub> ← P <sub>7</sub> P <sub>6</sub> P <sub>5</sub> P <sub>4</sub> P <sub>3</sub> P <sub>2</sub> P <sub>1</sub> P <sub>0</sub> if F <sub>n</sub> = 1	If a flag bit of the 16 flags specified by immediate data n <sub>3</sub> n <sub>2</sub> n <sub>1</sub> n <sub>0</sub> is 1, a branch to an address specified by immediate data P <sub>7</sub> to P <sub>0</sub> within the current page occurs.		Mnemonic is BF0 to BF15 according to the value of n.
	BNF <sub>n</sub> addr	Branch on no flag bit	1 0 0 1 P <sub>7</sub> P <sub>6</sub> P <sub>5</sub> P <sub>4</sub>	n <sub>3</sub> n <sub>2</sub> n <sub>1</sub> n <sub>0</sub> P <sub>3</sub> P <sub>2</sub> P <sub>1</sub> P <sub>0</sub>	2	2	PC <sub>7~0</sub> ← P <sub>7</sub> P <sub>6</sub> P <sub>5</sub> P <sub>4</sub> P <sub>3</sub> P <sub>2</sub> P <sub>1</sub> P <sub>0</sub> if F <sub>n</sub> = 0	If a flag bit of the 16 flags specified by immediate data n <sub>3</sub> n <sub>2</sub> n <sub>1</sub> n <sub>0</sub> is 0, a branch to an address specified by immediate data P <sub>7</sub> to P <sub>0</sub> within the current page occurs.		Mnemonic is BNF0 to BNF15 according to the value of n.
Input/output instructions	IP	Input port to AC	0 0 0 0	1 1 0 0	1	1	AC ← (P(DPL))	The contents of port P(DPL) are inputted to the AC.	ZF	
	OP	Output AC to port	0 1 1 0	0 0 0 1	1	1	P(DPL) ← (AC)	The AC contents are outputted to port P(DPL)		
	SPB bit	Set port bit	0 0 0 0	0 1 B <sub>1</sub> B <sub>0</sub>	1	2	P(DPL, B <sub>1</sub> B <sub>0</sub> ) ← 1	Immediate data B <sub>1</sub> B <sub>0</sub> -specified one bit in port P(DPL) is set.		Mnemonic is BNF0 to BNF15 according to the value of n.
	RPB bit	Reset port bit	0 0 1 0	0 1 B <sub>1</sub> B <sub>0</sub>	1	2	P(DPL, B <sub>1</sub> B <sub>0</sub> ) ← 0	Immediate data B <sub>1</sub> B <sub>0</sub> -specified one bit in port P(DPL) is reset.	ZF	When this instruction is executed, the E register contents are destroyed.
Other instructions	SCTL bit	Set control register bit(S)	0 0 1 0 1 0 0 0	1 1 0 0 B <sub>3</sub> B <sub>2</sub> B <sub>1</sub> B <sub>0</sub>	2	2	CTL ← (CTL) V B <sub>3</sub> B <sub>2</sub> B <sub>1</sub> B <sub>0</sub>	Immediate data B <sub>3</sub> B <sub>2</sub> B <sub>1</sub> B <sub>0</sub> -specified bits in the control register are set.		
	RCTL bit	Reset control register bit(S)	0 0 1 0 1 0 0 1	1 1 0 0 B <sub>3</sub> B <sub>2</sub> B <sub>1</sub> B <sub>0</sub>	2	2	CTL ← (CTL) A B <sub>3</sub> B <sub>2</sub> B <sub>1</sub> B <sub>0</sub>	Immediate data B <sub>3</sub> B <sub>2</sub> B <sub>1</sub> B <sub>0</sub> -specified bits in the control register are reset.	ZF	
	WTTM	Write timer	1 1 1 1	1 0 0 1	1	1	TM ← (E), (AC) TMF ← 0	The E and AC contents are loaded in the timer. The TMF is reset.	TMF	
	HALT	Halt	1 1 1 1	0 1 1 0	1	1	Halt	All operations stop.		
	NOP	No operation	0 0 0 0	0 0 0 0	1	1	No operation	No operation is performed, but 1 machine cycle is consumed.		

\*1 If the LI instruction or CLA instruction is used consecutively in such a manner as LI, LI, LI, -----, or CLA, CLA, CLA, -----, the first LI instruction or CLA instruction only is effective and the following LI instructions or CLA instructions are changed to the NOP instructions.

LC6500 Series Programming Model

Note  
 (1) The Branch instructions include the following instructions, and only when the branch conditions are met immediate data of ROM is loaded in the PC.  
 (2) AC<sup>z,c</sup>-----Suffix Z, C represent that the ZF, CF flags of the status register are affected.
