

**LC72147V**

PLL Frequency Synthesizer for Electronic Tuning in Car Audio Systems

Overview

The LC72147V is a PLL frequency synthesizer for car audio systems. It can implement high-performance multifunction tuners and features a crystal oscillator circuit that supports AM up-conversion, a fast locking circuit, an A/D converter, and an LA1783/1750 IF counter buffer control pin.

Functions

- High-speed programmable divider
 - FMIN: 10 to 180 MHz: Pulse swallower type
- IF counter
 - HCTR: 0.4 to 25 MHz: Frequency measurement
- Crystal oscillator: One of the following 4 frequencies may be selected: 10.35, 10.25, 7.2, and 4.5 MHz

Reference frequency

- One of 12 frequencies may be selected (when a 7.2 or 4.5 MHz crystal is used)
- 100^{*1}, 50, 30^{*2}, 25, 12.5, 6.25, 3.125, 10, 9^{*2}, 5, 3^{*2}, 1 kHz

Notes: 1. Cannot be used when a 10.35 or 10.25 MHz crystal is used

2. Cannot be used when a 10.25 MHz crystal is used

- Phase comparator
 - Supports dead band control
 - Built-in unlock detection circuit
 - Sub-charge pump for fast locking
 - Built-in deadlock clearing circuit
- Built-in MOS transistor for forming an active low-pass filter

- I/O ports — General-purpose I/O: 5 pins
 - Output: n-channel: 3 pins, CMOS: 2 pins
 - IFBC pin (LA1783/1750 IF counter buffer control pin)
- Serial data I/O
 - Supports communication with the controller in the CCB format.
- Operating ranges
 - Supply voltage (V_{DD}): 4.5 to 6.5 V
 - Built-in regulator voltage (V_{reg}): 3.0 V ($\pm 10\%$)
 - Operating temperature: -40 to $+85^{\circ}\text{C}$
- Package
 - SSOP-24

Package Dimensions

unit: mm

3175A-SSOP24

Specifications

Absolute Maximum Ratings at $T_a = 25^\circ\text{C}$, $V_{SS} = 0\text{ V}$

Parameter	Symbol	Pin	Conditions	Ratings	Unit
Supply voltage	$V_{DD\text{ max}}$	V_{DD}		-0.3 to +7.0	V
Maximum input voltage	$V_{IN1\text{ max}}$	CE, CL, DI, AIN		-0.3 to +7.0	V
	$V_{IN2\text{ max}}$	XIN, FMIN, HCTR, I/O-4, I/O-5, ADC0, ADC1		-0.3 to $V_{\text{reg}} + 0.3$	
	$V_{IN3\text{ max}}$	I/O-1 to I/O-3		-0.3 to +15	
Maximum output voltage	$V_{O1\text{ max}}$	DO		-0.3 to +7.0	V
	$V_{O2\text{ max}}$	XOUT, IFBC, I/O-4, I/O-5, PD, XBUF		-0.3 to $V_{\text{reg}} + 0.3$	
	$V_{O3\text{ max}}$	I/O-1 to I/O-3, AOUT		-0.3 to +15	
Maximum output current	$I_{O1\text{ max}}$	IFBC		0 to 1.0	mA
	$I_{O2\text{ max}}$	I/O-4, I/O-5, XBUF		0 to 3.0	
	$I_{O3\text{ max}}$	DO		0 to 6.0	
	$I_{O4\text{ max}}$	I/O-1 to I/O-3		0 to 10	
	$I_{O5\text{ max}}$	AOUT		0 to 35	
Allowable power dissipation	$P_{d\text{ max}}$		$T_a \leq 85^\circ\text{C}$	150	mW
Operating temperature	T_{opr}			-40 to +85	$^\circ\text{C}$
Storage temperature	T_{stg}			-55 to +125	$^\circ\text{C}$

Note: Power supply $V_{DD} - V_{SS}$, $V_{\text{reg}} - V_{SS}$: Capacitors of at least 2000 pF must be inserted between these pins when this device is used.

Allowable Operating Ranges at $T_a = -40$ to 85°C , $V_{SS} = 0\text{ V}$

Parameter	Symbol	Pin	Conditions	Ratings			Unit
				min	typ	max	
Supply voltage	V_{DD1}	V_{DD}		4.5		6.5	V
	V_{DD2}	V_{DD}	Serial data retention voltage	2.5			
Regulator output voltage	V_{reg}	V_{reg}	$4.5 \leq V_{DD} \leq 6.5\text{ V}$	2.7	3.0	3.3	V
High-level input voltage	V_{IH1}	CE, CL, DI, I/O-1 to I/O-3		2.2		6.5	V
	V_{IH2}	I/O-4, I/O-5		2.2		V_{reg}	
Low-level input voltage	V_{IL}	CE, CL, DI, I/O-1 to I/O-5		0		0.8	V
Output voltage	V_{O1}	DO		0		6.5	V
	V_{O2}	I/O-1 to I/O-3		0		13	
Input frequency	f_{IN1}	XIN	Sine wave, capacitance coupled	1.0		8.0	MHz
	f_{IN2}	FMIN	Sine wave, capacitance coupled	10		180	
	f_{IN3}	HCTR	Sine wave, capacitance coupled	0.4		25	
Guaranteed crystal oscillator frequency ranges	$X'tal1$	XIN, XOUT	*1	4.0		7.0	MHz
	$X'tal2$	XIN, XOUT	*1	7.1		10.5	
Input amplitude	V_{IN1}	XIN		200		900	mVrms
	V_{IN2-1}	FMIN	$10 \leq f < 130\text{ MHz}$ *2	40		900	
	V_{IN2-2}	FMIN	$130 \leq f \leq 180\text{ MHz}$ *2	70		900	
	V_{IN3-1}	HCTR	$0.4 \leq f \leq 25\text{ MHz}$ *3	70		900	
	V_{IN3-2}	HCTR	$8 \leq f \leq 12\text{ MHz}$ *4	100		900	
Input voltage range	V_{IN4}	ADC0, ADC1		0		V_{reg}	V
Data setup time	t_{SU}	DI, CL	*5	0.45			μs
Data hold time	t_{HD}	DI, CL	*5	0.45			μs
Clock low-level period	t_{CL}	CL	*5	0.45			μs
Clock high-level period	t_{CH}	CL	*5	0.45			μs
CE wait time	t_{EL}	CE, CL	*5	0.45			μs
CE setup time	t_{ES}	CE, CL	*5	0.45			μs
CE hold time	t_{EH}	CE, CL	*5	0.45			μs
Data latch change time	t_{LC}		*5			0.45	μs
Data output time	t_{DC}	DO, CL	Depends on the value of the pull-up resistor used.			0.2	μs
	t_{DH}	DO, CE					

Notes: 1. Recommended crystal oscillator CI values

$CI \leq 120\ \Omega$ (Crystal: 4.5 MHz), $CI \leq 70\ \Omega$ (Crystal: 7.2, 10.25, or 10.35 MHz)

Note that the crystal oscillator circuit characteristics depend on the printed circuit board and the particular components used. We recommend consulting the manufacturer of the crystal when designing this circuit.

2. Refer to the description of the structure of the programmable divider.
3. Serial data: CTC = 0
4. Serial data: CTC = 1
5. See the timing chart for serial data transfers.

LC72147V

Electrical Characteristics in the Allowable Operating Ranges

Parameter	Symbol	Pin	Conditions	Ratings			Unit

Pin No.	Symbol	Usage	Function	Pin circuit
11 13	I/O-4 I/O-5	General-purpose I/O ports	<ul style="list-style-type: none"> General-purpose I/O ports. The outputs are complementary output circuits. After the power-on reset, these ports function as input ports. The input/output state of these ports can be set using the I/O-4 and I/O-5 bits in the serial data sent from the controller. 	
18 19	ADC0 ADC1	A/D converter input	<ul style="list-style-type: none"> A/D converter input The A/D converter is a 6-bit successive-approximation circuit. See the item on the structure of the A/D converter for details. 	
7	PD	Charge pump output	<ul style="list-style-type: none"> PLL charge pump output When the frequency created by dividing the local oscillator signal frequency by N is higher than the reference frequency, a high level is output from the PD pin. When lower, a low level is output. The PD pin goes to the high-impedance state when the frequencies match. 	
15	HCTR	General-purpose counter	<ul style="list-style-type: none"> HCTR is selected by setting CTS in the control data to 1. Input frequency: 0.4 to 25 MHz The signal is input to a divide-by-2 circuit and the result is input to a general-purpose counter. This counter can also be used as an integrating counter. The counter value is output as the result of the count, MSB first, from the DO pin. See the item describing the structure of the general-purpose counter for details. 	
3	XBUF	Crystal oscillator buffer	<ul style="list-style-type: none"> Output buffer for the crystal oscillator circuit When XB in the serial data is set to 1, the output buffer operates and the crystal oscillator signal (a pulse signal) is output. When XB is 0, XBUF outputs a low level. (After the power-on reset, XB is set to 0 and the output buffer is fixed at the low level.) 	

Serial Data I/O Methods

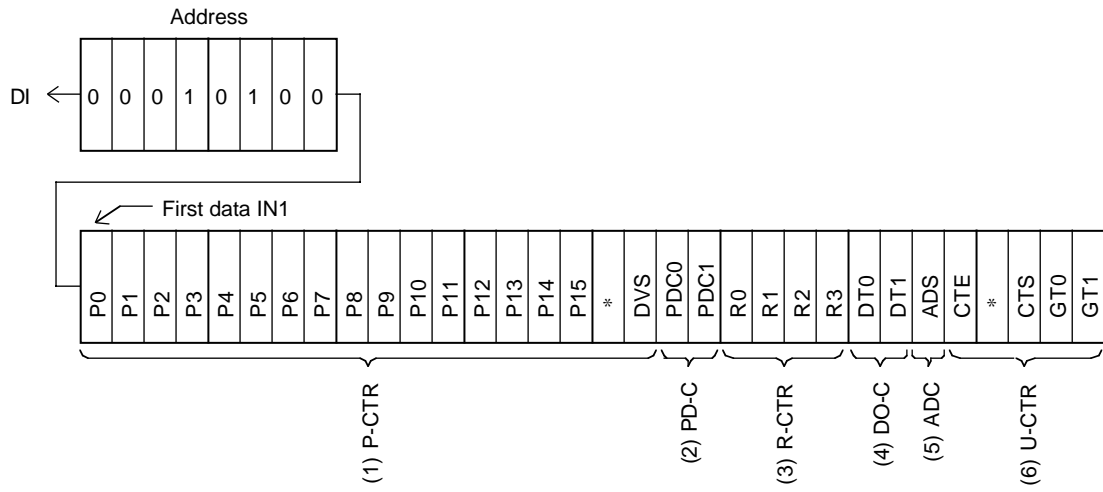

Data is input to and output from the LC72147V using the Sanyo CCB (Computer Control Bus) format, which is the serial bus format used by Sanyo audio ICs. This IC adopts a CCB format with an 8-bit address.

Serial data input (IN1/IN2) $t_{SU}, t_{HD}, t_{ES}, t_{EC}, t_{EH}, > 0.45 \mu s$ $t_{LC} < 0.45 \mu s$

Serial data output (OUT) $t_{SU}, t_{HD}, t_{ES}, t_{EC} > 0.45 \mu s$ $t_{DC}, t_{DH} < 0.2 \mu s$ *1

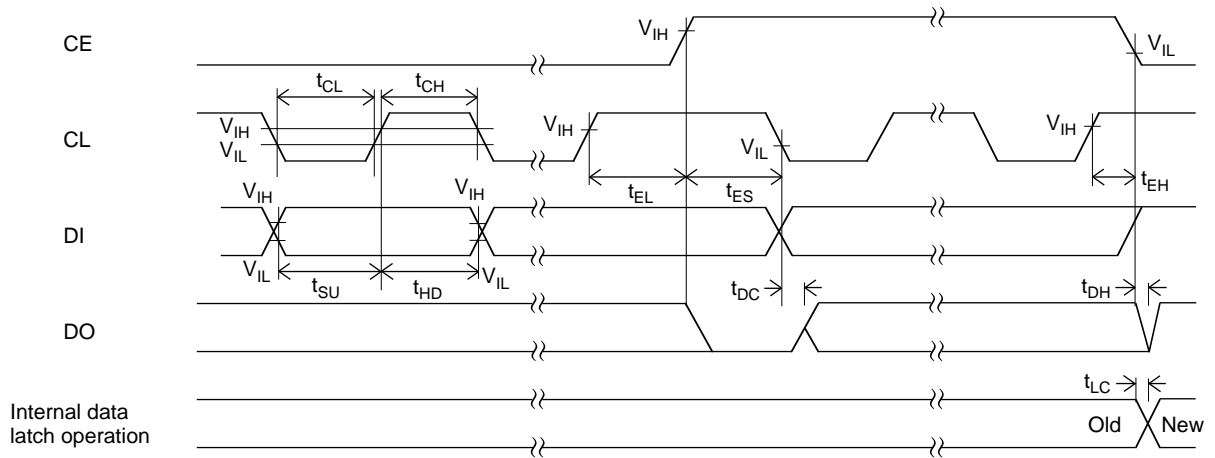

- Notes: 1. The DO pin is an n-channel open drain output, and thus the data switching time will differ depending on the value of the pull-up resistor used and the printed circuit board capacitance.
 2. The DO pin is normally open.

Serial data timing

<When CL is stopped at the low level>

<When CL is stopped at the high level>

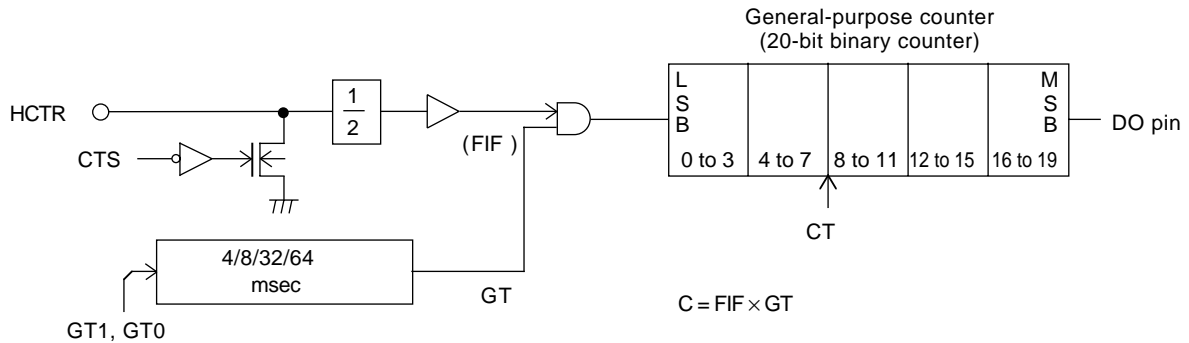

Programmable divider structure

DVS	Set divisor (N)	Input frequency range (f(MHz)) Minimum input sensitivity		FMIN
1	272 to 65535	$10 \leq f < 130$ 40 mVrms	$130 \leq f \leq 180$ 70 mVrms	Selected
0	—	—	—	Pulled down

General-purpose counter structure

The LC72147V's general-purpose counter is a 20-bit binary counter. The result of the count operation can be read out MSB first from the DO pin.

The measurement time when the general-purpose counter is used for frequency measurement is set to either 4, 8, 32, or 64 ms by the GT0 and GT1 bits. The frequency of the input to the HCTR pin can be measured by determining how many pulses were input to the general-purpose counter during this measurement time.

Check signal frequency

X'tal OSC	4.5 MHz	7.2 MHz	10.25 MHz	10.35 MHz	
				fref = 30, 9, 3 kHz	fref : other than 30, 9, 3 kHz
Check signal	900 kHz	900 kHz	1025 kHz	1030 kHz	1150 kHz

The CTC data switches the input sensitivity. The input sensitivity is reduced when CTC is set to 1.

CTC	HCTR: Minimum input sensitivity rating		
	$0.4 \leq f < 8$	$8 \leq f < 12$	$12 \leq f < 25$
0 (Normal mode)	70 mVrms	70 mVrms (10 to 20 mVrms)	70 mVrms
1 (Reduced sensitivity mode)	—	100 mVrms (30 to 40 mVrms)	—

—: No sensitivity rating (not guaranteed)
(): Rated value (reference value)

CTP data: Determines the state of the general-purpose counter input pin (HCTR) when the general-purpose counter is reset (CTE = 0).

CTP = 0: The general-purpose counter input pin is pulled down.

1: The general-purpose counter input pin is not pulled down, and the wait time is shortened by 1 to 2 ms.

IF CTP is to be set to 1, set CTP to 1 at least 4 ms before the counter is started by setting CTE to 1.

Leave CTP set to 0 if the counter will not be used.

GT1	GT0	Frequency measurement mode		
		Measurement time	Wait time	
			CTP = 0	CTP = 1
0	0	4 ms	3 to 4 ms	1 to 2 ms
0	1	8 ms		
1	0	32 ms	7 to 8 ms	
1	1	64 ms		

IF counter operation

Reset the general-purpose counter in advance by setting CTE to 0 before starting the counter.

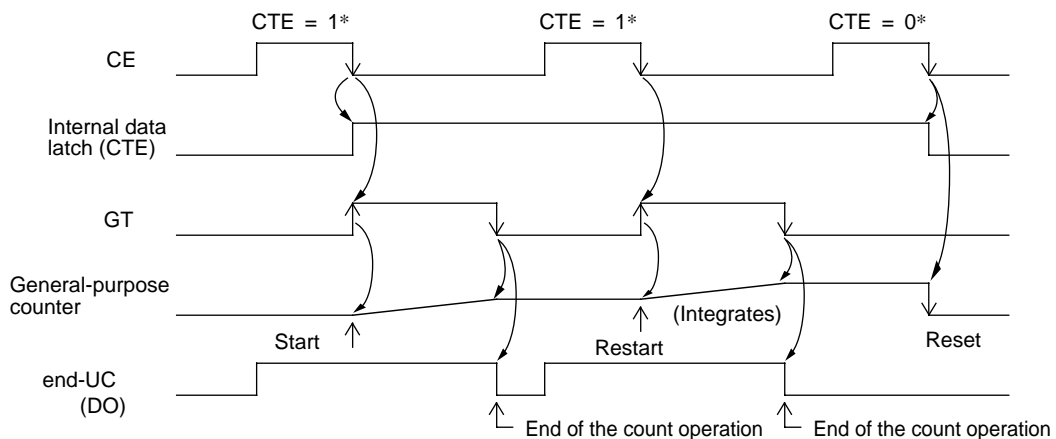

A general-purpose counter count operation is started by setting the CTE bit in the serial data to 1. The serial data takes effect internally to the LC72147V when the CE pin input level is changed from high to low. The input to the HCTR pin must be provided before the wait time has elapsed after CE was set low.

Next, the result of the general-purpose counter count after the measurement completes must be read out while CTE is still set to 1. This is because the general-purpose counter is reset when CTE is set to 0.

Note that the signal input to the HCTR pin is first divided by 2 internally to the IC and then input to the general-purpose counter. Therefore, the result of the general-purpose counter count is a value that corresponds to 1/2 of the frequency actually input to the HCTR pin.

When used as an integrating counter

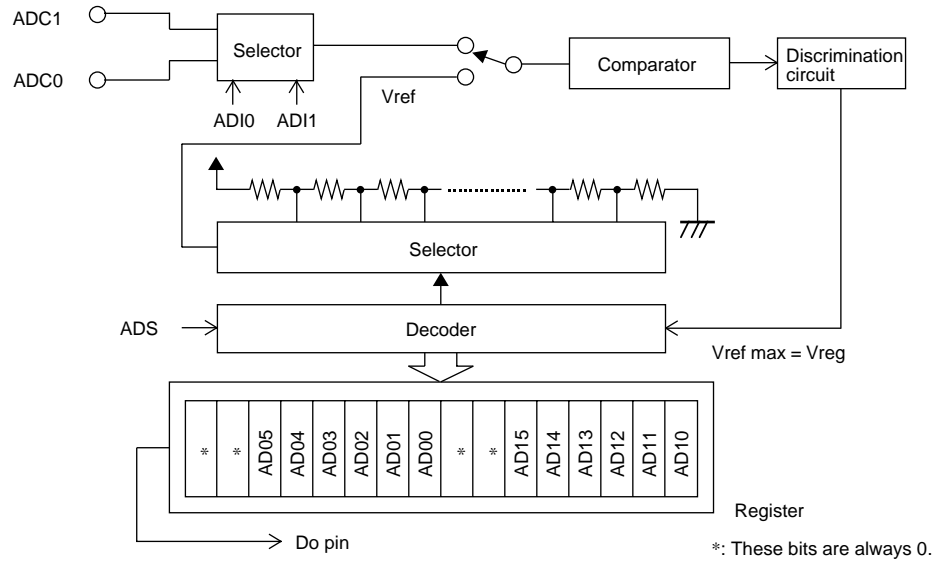

- *CTE: 0 → • Resets the general-purpose counter
- 1 → { • Starts the general-purpose counter
- Restarts the counter if set to 1 again.

In integrating count mode, the count value of the general-purpose counter is accumulated. Care must be taken to handle counter overflow correctly. The count value will be in the range 0_H to FFFFF_H.

An integrating count operation is performed by sending the serial data (IN1) again with the CTE bit still set to 1. This restarts the general-purpose counter measurement operation and adds the new counts to the previous counter value.

A/D converter structure

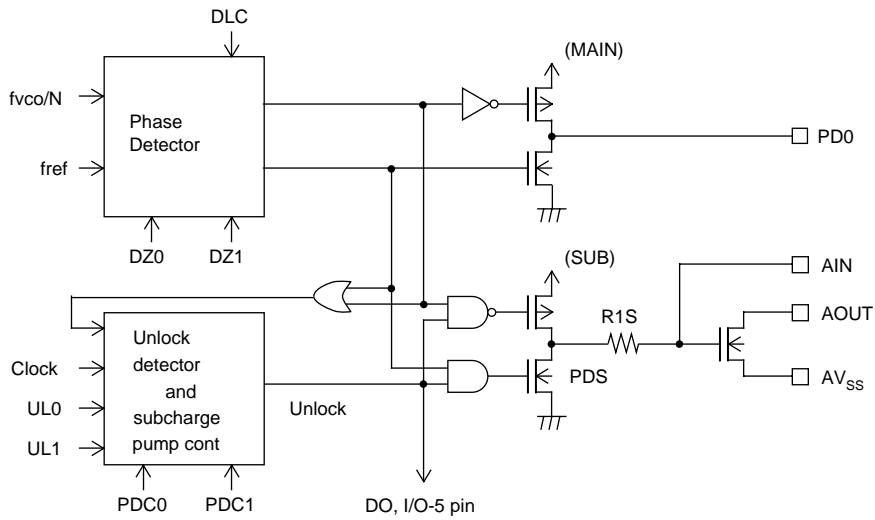

The LC72147V A/D converter is a 6-bit successive-approximation converter. It features a conversion time of about 17 μ s. The full-scale voltage level is the Vreg level, which corresponds to a data value of 3FH.

AD11	AD10	Input pin
1	1	Illegal setting
1	0	ADC0
0	1	ADC1
0	0	ADC0/ADC1

Charge pump structure

PDC1	PDC0	PDS (Sub-charge pump state)
0	*	High impedance
1	0	Charge pump operating (PLL unlocked)
1	1	Charge pump operating (normal operation)

DLC	PD1, PD0, PDS
0	Normal operation
1	Forcibly set to the low level

When the unlocked state is detected when the channel is changed, the PDS (sub-charge pump) operates, R1 goes to RIM/R1S (R1S = 100 Ω), the low-pass filter time constant is reduced, and PLL locking is accelerated.

*: The unlock state detection bit UL1 must be set to 1. The unlock detection width is set to either ±0.5 μs or ±1.0 μs and when a phase difference larger than this is detected, the unlocked state is recognized and the sub-charge pump operates. When the state approaches the locked state and the phase difference becomes less than the amount set as the unlock detection width, the sub-charge pump stops operating and the pin goes to the high-impedance state.

Other items

(1) Notes on the phase detector dead band

DZ1	DZ0	Dead band mode	Charge pump	Dead band
0	0	DZA	ON/ON	--0 s
0	1	DZB	ON/ON	-0 s
1	0	DZC	OFF/OFF	+0 s
1	1	DZD	OFF/OFF	++0 s

When the charge pump operates in ON/ON mode, the charge pump generates correction pulses even when the PLL is locked. Here, it is easy for the loop to become unstable, and special care is required in designs that use this mode.

The following problems may occur in ON/ON mode.

- Side bands may be generated due to reference frequency leakage.
- Side bands may be generated due low-frequency leakage due to the envelope of the correction pulses.

When a dead band is present (OFF/OFF mode), the loop will be stable, but it will be harder to acquire a good C/N ratio. On the other hand, with the mode that does not have a dead band (ON/ON mode), it will be easier to acquire a high C/N ratio, but harder to acquire loop stability.

Therefore, the DZA and DZB modes, in which there is no dead band, can be effective if either a high signal-to-noise ratio of 90 to 100 dB in FM reception or an increased pilot margin in AM stereo reception is required.

Inversely, if such a high FM signal-to-noise ratio is not required for FM reception, or an adequate pilot margin can be acquired for AM stereo reception, then the DZC and DZD modes, in which a dead band is present, may be more effective.

Dead zone (dead band) definition

The phase comparator compares f_p with the reference frequency (f_r) as shown in figure 1. This circuit outputs a voltage V (A) that is proportional to the phase difference ϕ as shown in figure 2. However, due to internal delays and other factors, the actual IC is unable to compare small phase differences, and thus a dead zone (B) appears in the output. To achieve a high signal-to-noise ratio in the end product, the dead zone should be as small as possible.

However, in popularly-priced models, there are cases where a somewhat wider dead zone may be easier to work with. This is because in some situations, such as when a powerful signal is applied to the RF input, in popularly-priced models there may be RF leakage from the mixer to the VCC. When the dead zone is narrow, outputs to correct this leakage are output, that output in turn modulates the VCO, and generates a beat signal with the RF.

Figure 1

Figure 2

(2) Notes on the FMIN and HCTR pins

The coupling capacitor must be located as close as possible to these pins. A capacitance of approximately 100 pF is desirable.

In particular, if the HCTR pin capacitor is over about 1000 pF, the time required to reach the bias level may become excessive, and incorrect counting may occur due to the relationship with the wait time.

(3) Notes on the IF counting → SD must be used in conjunction with IF counting.

If the general-purpose counter is used to count the IF frequency, the application microcontroller must test the state of the IF IC SD (station detect) signal, and only if the SD signal is present, turn on the IF counter buffer output and perform an IF count operation. Methods in which auto-search operations are implemented only using the IF count may incorrectly stop at frequencies where no station is present due to leakage from the IF counter buffer.

(4) Using the DO pin

At times other than data output mode, the DO pin can also be used to check for general-purpose counter count operation completion, to output the unlock state detection signal, and to check for changes in the input pins.

Note that the states of the input pins (I/O-1 and I/O-2) can be directly input to the system microcontroller through the DO pin.

(5) Power supply pins

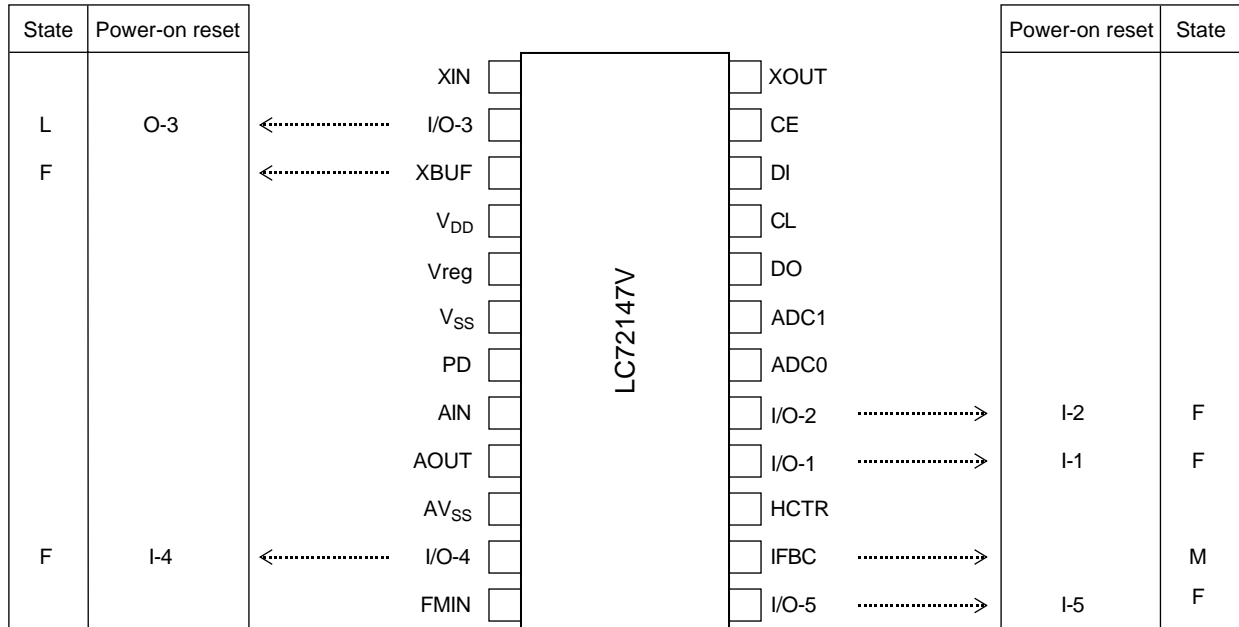

Capacitors of over 2000 pF must be inserted between the VDD and VSS power supply pins and between Vreg and VSS to reduce noise. These capacitors must be located as close to the VDD, Vreg, and VSS pins as possible.

LC72147V

(6) Notes on VCO design

The VCO must be designed so that the VCO oscillation does not stop if the control voltage (V_{tune}) becomes 0 V. If it is possible for this oscillator to stop, use the charge pump control data (DLC) to forcible set V_{tune} to VCC temporarily to prevent the PLL circuit from deadlocking. (This function is called a deadlock clear circuit.)
