

LMV358

LINEAR INTEGRATED CIRCUIT

GENERAL PURPOSE, LOW VOLTAGE, RAIL-TO-RAIL OUTPUT OPERATIONAL AMPLIFIERS

DESCRIPTION

The UTC **LMV358** are low voltage (2.7-5.5V) versions of the dual and quad commodity op amps, LM358, which currently operate at 5-30V. The UTC **LMV358** are the most cost effective solutions for the applications where low voltage operation, space saving and low price are needed. They offer specifications that meet or exceed the familiar LM358. The UTC **LMV358** have rail-to-rail output swing capability and the input common-mode voltage range includes ground. They all exhibit excellent speed-power ratio, achieving 1MHz of bandwidth and 1V/ μ s of slew rate with low supply current.

The chips are built with National's advanced submicron silicon-gate BiCMOS process. The UTC **LMV358** have bipolar input and output stages for improved noise performance and higher output current drive.

FEATURES

(For $V^1 = 5V$ and $V = 0V$. Typical Unless Otherwise Noted)

*Guaranteed 2.7V and 5V Performance

*No Crossover Distortion

*Space Saving Package

*Industrial Temp. Range

*Gain-Bandwidth Product

*Low Supply Current: 210 μ A

*Rail-to-Rail Output Swing

@10k Ω Load $V^1 - 10mV$
 $V + 65mV$

* V_{CM} -0.2V to $V^1 - 0.8V$

Note1: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performances is not guaranteed. For guaranteed specifications and the test conditions, see the Electrical Characteristics.

Note2: Human body model 1.5k Ω in series with 100pF. Machine model, 0 Ω in series with 200pF.

Note3: Shorting output to V^1 will adversely affect reliability.

Note4: Shorting output to V^+ will adversely affect reliability.

Note5: The maximum power dissipation is a function of $T_J(\text{max})$, θ_{JA} and T_A . The maximum allowable power dissipation at any ambient temperature is $P_D = (T_J(\text{max}) - T_A) / \theta_{\text{JA}}$. All numbers apply for packages soldered directly into a PC board.

Note6: R_L is connected to V. The output voltage is $0.5\text{V} \leq V_{\text{OUT}} \leq 4.5\text{V}$.

Note7: Connected as voltage follower with 3V step input. Number specified is these lower of the positive and negative slew rates.

Note8: all numbers are typical, and apply for packages soldered directly note a PC board is still air.
