Note 1: The timing and pulse width of the horizontal blanking pulse should be as shown in the following figure by adjusting the variable resistor of the single shot multi vibrator.

The variable resistor at pin 15 of the TTL IC, M74LS221P, is used to fix the timing at 8μs and that at pin 7 is used to fix the pulse width at 12μs.

Coil adjustment

VCO coil

1. Set the test conditions as shown in the parameter V14.
2. Input CW ($f_0=38.9\text{MHz}$, $V_i=90\text{dB}\mu$) to input pin A.
3. Set the DC voltage at pin 1 (AFT OUT) to 1/2Vcc (4.0V) by adjusting VCO coil.

Note) VCO coil should always be adjusted as above before using this IC.

INPUT SIGNAL PARAMETERS INCLUDING INPUT SIGNALS

1. Input signal name is four alphanumeric characters.

First character: Standard=S, Nonstandard=V (Modified parts should be specified.)

Second character: Meaning of signal

Third character: Frequency of burst and chroma
4(4.433619MHz), 3(3.579545MHz) (In case of "S", SECAM standard signal is applied.)

Fourth character: Color system
N(NTSC), P(PAL)

2. Structure of input color signal

The following figure shows the structure of color signal.

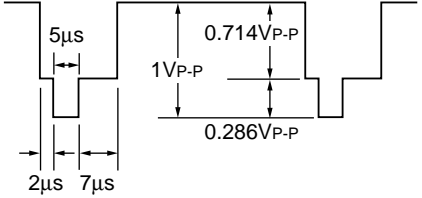

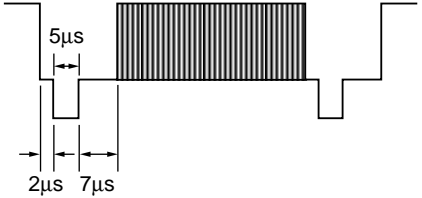

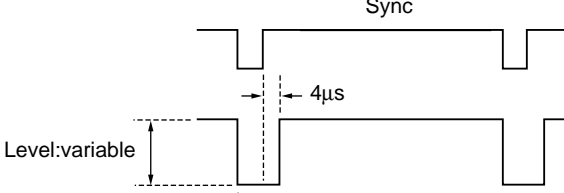

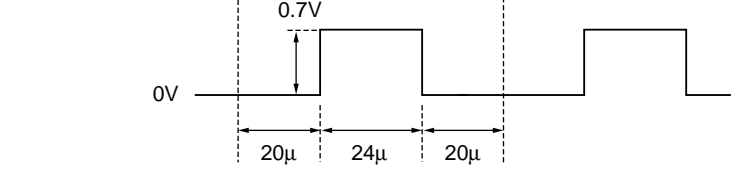

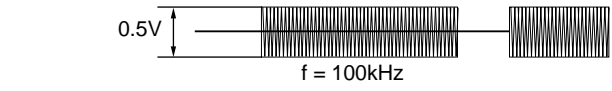

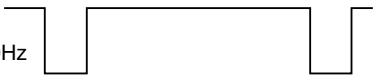

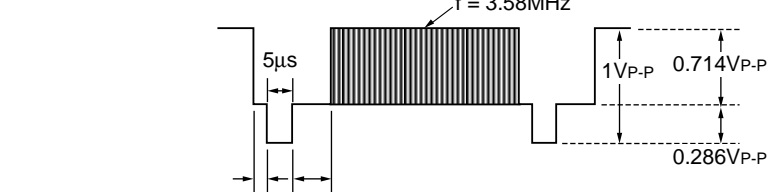

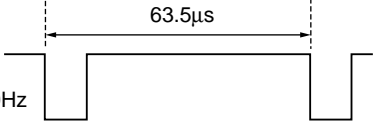

1. When S (standard) is used as the first character, the standard color bar signal of each system is applied. H.sync should be added for input clamp. (The frequency of H.sync is fixed according to the fourth character. P:50Hz, N:60Hz)
2. Amplitude and frequency of burst are represented as eb. In case of standard signal, the amplitude is 285mV_{P-P} and the frequency is shown by the third character.
3. Amplitude and frequency of chroma are represented as ec. In case of standard signal, the amplitude is 570mV_{P-P} and the frequency is shown by the third character.
4. The following figure shows the phase of a PAL system signal.
