Some parametric limits are subject to change

### 4194304-BIT (262144-WORD BY 16-BIT) CMOS STATIC RAM

#### DESCRIPTION

The M5M5V416B is a family of low voltage 4-Mbit static RAMs organized as 262,144-words by 16-bit, fabricated by Mitsubishi's high-performance 0.25µm CMOS technology.

The M5M5V416B is suitable for memory applications where a simple interfacing, battery operating and battery backup are the important design objectives.

M5M5V416BTP,RT are packaged in a 44-pin 400mil thin small outline package. M5M5V416BTP (normal lead bend type package), M5M5V416BRT (reverse lead bend type package), both types are very easy to design a printed circuit board.

From the point of operating temperature, the family is divided into three versions; "Standard", "W-version", and "I-version". Those are summarized in the part name table below.

#### FEATURES

- Single +2.7~+3.6V power supply
- Small stand-by current: 0.3µA(3V,typ.)
- No clocks, No refresh
- Data retention supply voltage=2.0V to 3.6V
- All inputs and outputs are TTL compatible.
- Easy memory expansion by  $\overline{S1}$ ,  $\overline{S2}$ ,  $\overline{BC1}$  and  $\overline{BC2}$
- Common Data I/O
- Three-state outputs: OR-tie capability
- $\overline{OE}$  prevents data contention in the I/O bus
- Process technology: 0.25µm CMOS
- Package: 44 pin 400mil TSOP (II)

Version, Operating temperature	Part name	Power Supply	Access time max.	Stand-by current I <sub>cc</sub> (PD), V <sub>cc</sub> =3.0V						Active current I <sub>cc1</sub> (3.0V, typ.)

\* "typical" parameter is sampled, not 100% tested.

#### PIN CONFIGURATION

Pin	Function
A0 ~ A17	Address input
DQ1 ~ DQ16	Data input / output
$\overline{S1}$	Chip select input 1
$\overline{S2}$	Chip select input 2
$\overline{W}$	Write control input
$\overline{OE}$	Output enable input
$\overline{BC1}$	Lower Byte (DQ1 ~ 8)
$\overline{BC2}$	Upper Byte (DQ9 ~ 16)
V <sub>cc</sub>	Power supply
GND	Ground supply

Outline: 44P3W-H/J  
NC: No Connection

## 4194304-BIT (262144-WORD BY 16-BIT) CMOS STATIC RAM

### FUNCTION

The M5M5V416BTP,RT are organized as 262,144-words by 16-bit. These devices operate on a single +2.7~3.6V power supply, and are directly TTL compatible to both input and output. Its fully static circuit needs no clocks and no refresh, and makes it useful.

The operation mode are determined by a combination of the device control inputs  $\overline{BC1}$ ,  $\overline{BC2}$ ,  $\overline{S1}$ ,  $\overline{S2}$ ,  $\overline{W}$  and  $\overline{OE}$ . Each mode is summarized in the function table.

A write operation is executed whenever the low level  $\overline{W}$  overlaps with the low level  $\overline{BC1}$  and/or  $\overline{BC2}$  and the low level  $\overline{S1}$  and the high level  $\overline{S2}$ . The address(A0~A17) must be set up before the write cycle and must be stable during the entire cycle.

A read operation is executed by setting  $\overline{W}$  at a high level and  $\overline{OE}$  at a low level while  $\overline{BC1}$  and/or  $\overline{BC2}$  and  $\overline{S1}$  and  $\overline{S2}$  are in an active state( $\overline{S1}=L, \overline{S2}=H$ ).

When setting  $\overline{BC1}$  at the high level and other pins are in an active stage, upper-byte are in a selectable mode in which both reading and writing are enabled, and lower-byte are in a non-selectable mode. And when setting  $\overline{BC2}$  at a high level and other pins are in an active stage, lower-byte are in a selectable mode and upper-byte are in a non-selectable mode.

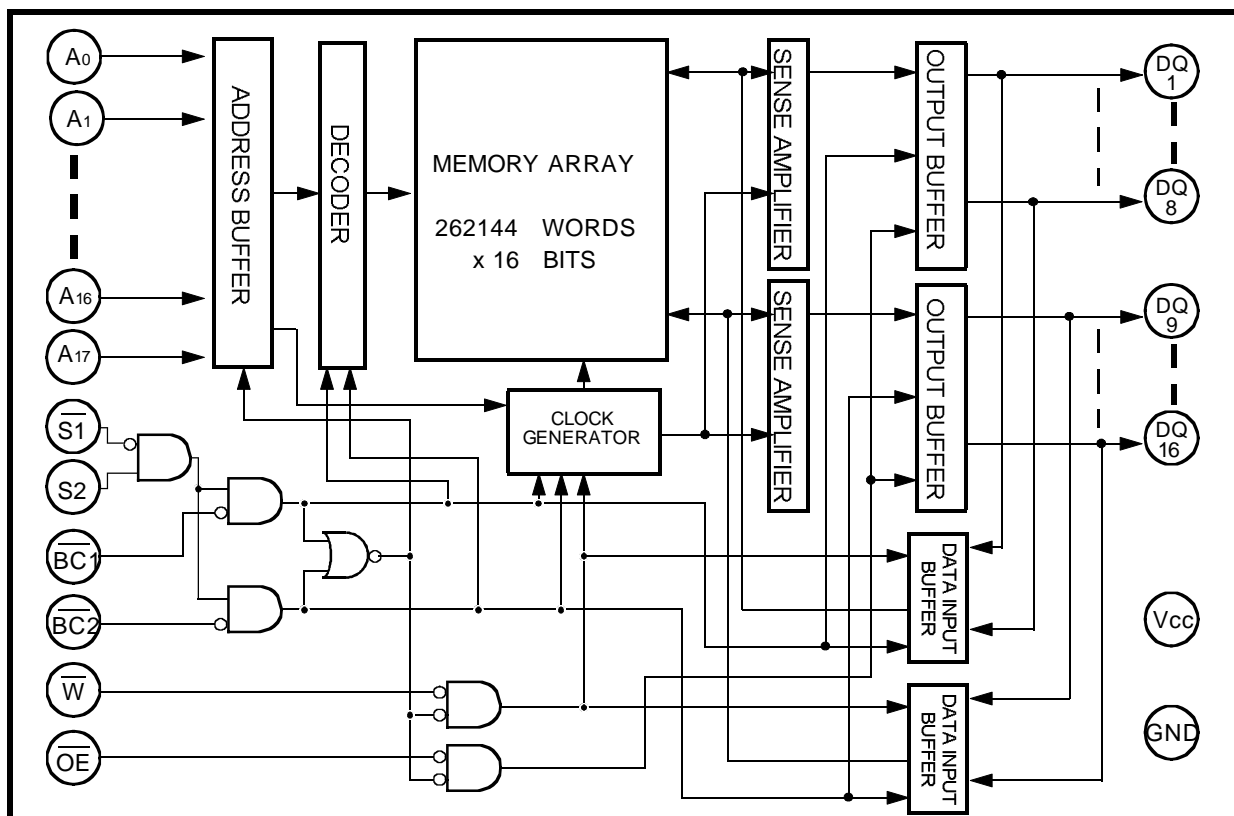

When setting  $\overline{BC1}$  and  $\overline{BC2}$  at a high level or  $\overline{S1}$  at a high level or  $\overline{S2}$  at a low level, the chips are in a non-selectable mode in which both reading and writing are disabled. In this mode, the output stage is in a high-impedance state, allowing OR-tie with other chips and memory expansion by  $\overline{BC1}$ ,  $\overline{BC2}$  and  $\overline{S1}$ ,  $\overline{S2}$ .

The power supply current is reduced as low as 0.3 $\mu$ A(25°C, typical), and the memory data can be held at +2V power supply, enabling battery back-up operation during power failure or power-down operation in the non-selected mode.

### FUNCTION TABLE

$\overline{S1}$	$\overline{S2}$	$\overline{BC1}$	$\overline{BC2}$	$\overline{W}$	$\overline{OE}$	Mode	DQ1-8	DQ9-16	I <sub>cc</sub>
