

M80C186XL20, 16, 12, 10 16-BIT HIGH-INTEGRATION EMBEDDED PROCESSOR

- **Low Power, Full Static Version of M80C186**
- **Operation Modes:**
 - Enhanced Mode
 - DRAM Refresh Control Unit
 - Power-Save Mode
 - Direct Interface to 80C187
 - Compatible Mode
 - NMOS 80186 Pin-for-Pin Replacement for Non-Numerics Applications
- **Integrated Feature Set**
 - Static, Modular CPU
 - Clock Generator
 - 2 Independent DMA Channels
 - Programmable Interrupt Controller
 - 3 Programmable 16-Bit Timers
 - Dynamic RAM Refresh Control Unit
 - Programmable Memory and Peripheral Chip Select Logic
 - Programmable Wait State Generator
 - Local Bus Controller
 - Power-Save Mode
 - System-Level Testing Support (High Impedance Test Mode)
- **Completely Object Code Compatible with Existing 8086/8088 Software and Has 10 Additional Instructions over 8086/8088**
- **Speed Versions Available**
 - 20 MHz (M80C186XL20)
 - 16 MHz (M80C186XL16)
 - 12.5 MHz (M80C186XL12)
 - 10 MHz (M80C186XL)
- **Direct Addressing Capability to 1 MByte Memory and 64 Kbyte I/O**
- **Complete System Development Support**
 - All 8086 and 80C186 Software Development Tools Can Be Used for M80C186XL System Development
 - ASM 86 Assembler, PL/M-86, Pascal-86, Fortran-86, iC-86 and System Utilities
 - In-Circuit-Emulator (ICE™-186)
- **Available in 68-Pin:**
 - Ceramic Pin Grid Array (PGA)
- **Military Temperature Range:**
 - -55°C to +125°C (T_C)

The Intel M80C186XL is a Modular Core re-implementation of the M80C186 microprocessor. It offers higher speed and lower power consumption than the standard M80C186 but maintains 100% clock-for-clock functional compatibility. Packaging and pinout are also identical.

Figure 1. M80C186XL Block Diagram

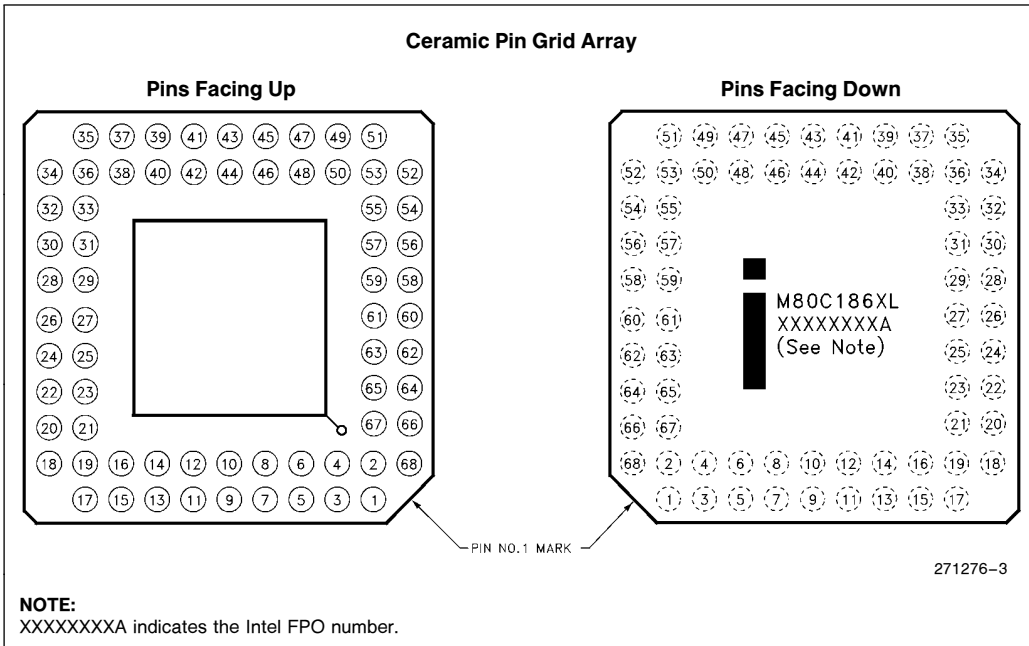

Figure 2. M80C186XL Pinout Diagrams

Table 1. M80C186XL Pin Description

Symbol	PGA Pin No.	Type	Name and Function
V _{CC}	9 43	I I	System Power: +5 volt power supply.
V _{SS}	26 60	I I	System Ground.
RESET	57	O	RESET Output indicates that the M80C186XL CPU is being reset, and can be used as a system reset. It is active HIGH, synchronized with the processor clock, and lasts an integer number of clock periods corresponding to the length of the RES signal. Reset goes inactive 2 clockout periods after RES goes inactive. When tied to the TEST/BUSY pin, RESET forces the M80C186XL into enhanced mode. RESET is not floated during bus hold.
X1 X2	59 58	I O	Crystal Inputs X1 and X2 provide external connections for a fundamental mode or third overtone parallel resonant crystal for the internal oscillator. X1 can connect to an external clock instead of a crystal. In this case, minimize the capacitance on X2. The input or oscillator frequency is internally divided by two to generate the clock signal (CLKOUT).
CLKOUT	56	O	Clock Output provides the system with a 50% duty cycle waveform. All device pin timings are specified relative to CLKOUT. CLKOUT is active during reset and bus hold.
RES	24	I	An active RES causes the M80C186XL to immediately terminate its present activity, clear the internal logic, and enter a dormant state. This signal may be asynchronous to the M80C186XL clock. The M80C186XL begins fetching instructions approximately 6½ clock cycles after RES is returned HIGH. For proper initialization, V _{CC} must be within specifications and the clock signal must be stable for more than 4 clocks with RES held LOW. RES is internally synchronized. This input is provided with a Schmitt-trigger to facilitate power-on RES generation via an RC network.
TEST/BUSY	47	I/O	<p>The TEST pin is sampled during and after reset to determine whether the M80C186XL is to enter Compatible or Enhanced Mode. Enhanced Mode requires TEST to be HIGH on the rising edge of RES and LOW four CLKOUT cycles later. Any other combination will place the M80C186XL in Compatible Mode. During power-up, active RES is required to configure TEST/BUSY as an input. A weak internal pullup ensures a HIGH state when the input is not externally driven.</p> <p>TEST—In Compatible Mode this pin is configured to operate as TEST. This pin is examined by the WAIT instruction. If the TEST input is HIGH when WAIT execution begins, instruction execution will suspend. TEST will be resampled every five clocks until it goes LOW, at which time execution will resume. If interrupts are enabled while the M80C186XL is waiting for TEST, interrupts will be serviced.</p> <p>BUSY—In Enhanced Mode, this pin is configured to operate as BUSY. The BUSY input is used to notify the M80C186XL of Math Coprocessor activity. Floating point instructions executing in the M80C186XL sample the BUSY pin to determine when the Math Coprocessor is ready to accept a new command. BUSY is active HIGH.</p>

Table 1. M80C186XL Pin Description (Continued)

Symbol	PGA Pin No.	Type	Name and Function
TMR IN 0 TMR IN 1	20 21	I I	Timer Inputs are used either as clock or control signals, depending upon the programmed timer mode. These inputs are active HIGH (or LOW-to-HIGH transitions are counted) and internally synchronized. Timer Inputs must be tied HIGH when not being used as clock or retrigger inputs.
TMR OUT 0 TMR OUT 1	22 23	O O	Timer outputs are used to provide single pulse or continuous waveform generation, depending upon the timer mode selected. These outputs are not floated during a bus hold.
DRQ0 DRQ1	18 19	I I	DMA Request is asserted HIGH by an external device when it is ready for DMA Channel 0 or 1 to perform a transfer. These signals are level-triggered and internally synchronized.
NMI	46	I	The Non-Maskable Interrupt input causes a Type 2 interrupt. An NMI transition from LOW to HIGH is latched and synchronized internally, and initiates the interrupt at the next instruction boundary. NMI must be asserted for at least one CLKOUT period. The Non-Maskable Interrupt cannot be avoided by programming.
INT0 INT1/SELECT INT2/INTA0 INT3/INTA1/IRQ	45 44 42 41	I I I/O I/O	Maskable Interrupt Requests can be requested by activating one of these pins. When configured as inputs, these pins are active HIGH. Interrupt Requests are synchronized internally. INT2 and INT3 may be configured to provide active-LOW interrupt-acknowledge output signals. All interrupt inputs may be configured to be either edge- or level-triggered. To ensure recognition, all interrupt requests must remain active until the interrupt is acknowledged. When Slave Mode is selected, the function of these pins changes (see Interrupt Controller section of this data sheet).
A19/S6 A18/S5 A17/S4 A16/S3	65 66 67 68	O O O O	Address Bus Outputs (16–19) and Bus Cycle Status (3–6) indicate the four most significant address bits during T ₁ . These signals are active HIGH. During T ₂ , T ₃ , T _W and T ₄ , the S6 pin is LOW to indicate a CPU-initiated bus cycle or HIGH to indicate a DMA-initiated or refresh bus cycle. During the same T-states, S3, S4 and S5 are always LOW. These outputs are floated during bus hold or reset.
AD15 AD14 AD13 AD12 AD11 AD10 AD9 AD8 AD7 AD6 AD5 AD4 AD3 AD2 AD1 AD0	1 3 5 7 10 12 14 16 2 4 6 8 11 13 15 17	I/O I/O I/O I/O I/O I/O I/O I/O I/O I/O I/O I/O I/O I/O I/O	Address/Data Bus (0–15) signals constitute the time multiplexed memory or I/O address (T ₁) and data (T ₂ , T ₃ , T _W and T ₄) bus. The bus is active HIGH. A ₀ is analogous to BHE for the lower byte of the data bus, pins D ₇ through D ₀ . It is LOW during T ₁ when a byte is to be transferred onto the lower portion of the bus in memory or I/O operations. These pins are floated during a bus hold or reset.

Table 1. M80C186XL Pin Description (Continued)

Symbol	PGA Pin No.	Type	Name and Function		
$\overline{\text{BHE}}$	64	O	The $\overline{\text{BHE}}$ (Bus High Enable) signal is analogous to A0 in that it is used to enable data on to the most significant half of the data bus, pins D15–D8. $\overline{\text{BHE}}$ will be LOW during T_1 when the upper byte is transferred and will remain LOW through T_3 AND T_W . $\overline{\text{BHE}}$ does not need to be latched. $\overline{\text{BHE}}$ will float during HOLD or RESET. In Enhanced Mode, $\overline{\text{BHE}}$ will also be used to signify DRAM refresh cycles. A refresh cycle is indicated by both $\overline{\text{BHE}}$ and A0 being HIGH.		
			$\overline{\text{BHE}}$ and A0 Encodings		
			$\overline{\text{BHE}}$ Value	A0 Value	Function
			0	0	Word Transfer
0	1	Byte Transfer on upper half of data bus (D15–D8)			
1	0	Byte Transfer on lower half of data bus (D7–D0)			
1	1	Refresh			
ALE/QS0	61	O	Address Latch Enable/Queue Status 0 is provided by the M80C186XL to latch the address. ALE is active HIGH, with addresses guaranteed valid on the trailing edge.		
$\overline{\text{WR}}/\text{QS1}$	63	O	Write Strobe/Queue Status 1 indicates that the data on the bus is to be written into a memory or an I/O device. It is active LOW, and floats during bus hold or reset. When the M80C186XL is in Queue Status Mode, the ALE/QS0 and $\overline{\text{WR}}/\text{QS1}$ pins provide information about processor/instruction queue interaction.		
			QS1	QS0	Queue Operation
			0	0	No queue operation
			0	1	First opcode byte fetched from the queue
1	1	Subsequent byte fetched from the queue			
1	0	Empty the queue			
$\overline{\text{RD}}/\text{QSMD}$	62	O/I	Read Strobe is an active LOW signal which indicates that the M80C186XL is performing a memory or I/O read cycle. It is guaranteed not to go LOW before the A/D bus is floated. An internal pull-up ensures that $\overline{\text{RD}}/\text{QSMD}$ is HIGH during RESET. Following RESET the pin is sampled to determine whether the M80C186XL is to provide ALE, $\overline{\text{RD}}$, and $\overline{\text{WR}}$, or queue status information. To enable Queue Status Mode, $\overline{\text{RD}}$ must be connected to GND. $\overline{\text{RD}}$ will float during bus HOLD.		
ARDY	55	I	Asynchronous Ready informs the M80C186XL that the addressed memory space or I/O device will complete a data transfer. The ARDY pin accepts a rising edge that is asynchronous to CLKOUT and is active HIGH. The falling edge of ARDY must be synchronized to the M80C186XL clock. Connecting ARDY HIGH will always assert the ready condition to the CPU. If this line is unused, it should be tied LOW to yield control to the SRDY pin.		
SRDY	49	I	Synchronous Ready informs the M80C186XL that the addressed memory space or I/O device will complete a data transfer. The SRDY pin accepts an active-HIGH input synchronized to CLKOUT. The use of SRDY allows a relaxed system timing over ARDY. This is accomplished by elimination of the one-half clock cycle required to internally synchronize the ARDY input signal. Connecting SRDY high will always assert the ready condition to the CPU. If this line is unused, it should be tied LOW to yield control to the ARDY pin.		

Table 1. M80C186XL Pin Description (Continued)

Symbol	PGA Pin No.	Type	Name and Function																																								
$\overline{\text{LOCK}}$	48	O	$\overline{\text{LOCK}}$ output indicates that other system bus masters are not to gain control of the system bus. $\overline{\text{LOCK}}$ is active LOW. The $\overline{\text{LOCK}}$ signal is requested by the LOCK prefix instruction and is activated at the beginning of the first data cycle associated with the instruction immediately following the LOCK prefix. It remains active until the completion of that instruction. No instruction prefetching will occur while $\overline{\text{LOCK}}$ is asserted. $\overline{\text{LOCK}}$ floats during bus hold or reset.																																								
$\overline{\text{S0}}$ $\overline{\text{S1}}$ $\overline{\text{S2}}$	52 53 54	O O O	<p>Bus cycle status $\overline{\text{S0}}-\overline{\text{S2}}$ are encoded to provide bus-transaction information:</p> <table border="1"> <thead> <tr> <th colspan="4">M80C186XL Bus Cycle Status Information</th> </tr> <tr> <th>$\overline{\text{S2}}$</th> <th>$\overline{\text{S1}}$</th> <th>$\overline{\text{S0}}$</th> <th>Bus Cycle Initiated</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>0</td> <td>Interrupt Acknowledge</td> </tr> <tr> <td>0</td> <td>0</td> <td>1</td> <td>Read I/O</td> </tr> <tr> <td>0</td> <td>1</td> <td>0</td> <td>Write I/O</td> </tr> <tr> <td>0</td> <td>1</td> <td>1</td> <td>Halt</td> </tr> <tr> <td>1</td> <td>0</td> <td>0</td> <td>Instruction Fetch</td> </tr> <tr> <td>1</td> <td>0</td> <td>1</td> <td>Read Data from Memory</td> </tr> <tr> <td>1</td> <td>1</td> <td>0</td> <td>Write Data to Memory</td> </tr> <tr> <td>1</td> <td>1</td> <td>1</td> <td>Passive (no bus cycle)</td> </tr> </tbody> </table> <p>The status pins float during HOLD. $\overline{\text{S2}}$ may be used as a logical $\overline{\text{M}}/\overline{\text{IO}}$ indicator, and $\overline{\text{S1}}$ as a $\overline{\text{DT}}/\overline{\text{R}}$ indicator.</p>	M80C186XL Bus Cycle Status Information				$\overline{\text{S2}}$	$\overline{\text{S1}}$	$\overline{\text{S0}}$	Bus Cycle Initiated	0	0	0	Interrupt Acknowledge	0	0	1	Read I/O	0	1	0	Write I/O	0	1	1	Halt	1	0	0	Instruction Fetch	1	0	1	Read Data from Memory	1	1	0	Write Data to Memory	1	1	1	Passive (no bus cycle)
M80C186XL Bus Cycle Status Information

1	0	0	Instruction Fetch																																								
1	0	1	Read Data from Memory																																								
1	1	0	Write Data to Memory																																								
1	1	1	Passive (no bus cycle)																																								
HOLD HLDA	50 51	I O	<p>HOLD indicates that another bus master is requesting the local bus. The HOLD input is active HIGH. The M80C186XL generates HLDA (HIGH) in response to a HOLD request. Simultaneous with the issuance of HLDA, the M80C186XL will float the local bus and control lines. After HOLD is detected as being LOW, the M80C186XL will lower HLDA. When the M80C186XL needs to run another bus cycle, it will again drive the local bus and control lines.</p> <p>In Enhanced Mode, HLDA will go low when a DRAM refresh cycle is pending in the M80C186XL and an external bus master has control of the bus. It will be up to the external master to relinquish the bus by lowering HOLD so that the M80C186XL may execute the refresh cycle.</p>																																								
$\overline{\text{UCS}}$	34	O/I	<p>Upper Memory Chip Select is an active LOW output whenever a memory reference is made to the defined upper portion (1K–256K block) of memory. $\overline{\text{UCS}}$ does not float during bus hold. The address range activating $\overline{\text{UCS}}$ is software programmable.</p> <p>$\overline{\text{UCS}}$ and $\overline{\text{LCS}}$ are sampled upon the rising edge of $\overline{\text{RES}}$. If both pins are held low, the M80C186XL will enter ONCE Mode. In ONCE Mode all pins assume a high impedance state and remain so until a subsequent RESET. $\overline{\text{UCS}}$ has a weak internal pullup that is active during RESET to ensure that the M80C186XL does not enter ONCE Mode inadvertently.</p>																																								
$\overline{\text{LCS}}$	33	O/I	<p>Lower Memory Chip Select is active LOW whenever a memory reference is made to the defined lower portion (1K–256K) of memory. $\overline{\text{LCS}}$ does not float during bus HOLD. The address range activating $\overline{\text{LCS}}$ is software programmable.</p>																																								

Table 1. M80C186XL Pin Description (Continued)

Symbol	PGA Pin No.	Type	Name and Function
$\overline{\text{LCS}}$ (Continued)			$\overline{\text{UCS}}$ and $\overline{\text{LCS}}$ are sampled upon the rising edge of $\overline{\text{RES}}$. If both pins are held low, the M80C186XL will enter ONCE Mode. In ONCE Mode all pins assume a high impedance state and remain so until a subsequent RESET. $\overline{\text{LCS}}$ has a weak internal pullup that is active only during RESET to ensure that the M80C186XL does not enter ONCE mode inadvertently.
$\overline{\text{MCS0}}/\overline{\text{PEREQ}}$ $\overline{\text{MCS1}}/\overline{\text{ERROR}}$ $\overline{\text{MCS2}}$ $\overline{\text{MCS3}}/\overline{\text{NPS}}$	38 37 36 35	O/I O/I O O	Mid-Range Memory Chip Select signals are active LOW when a memory reference is made to the defined mid-range portion of memory (8K–512K). These lines do not float during bus HOLD. The address ranges activating $\overline{\text{MCS0}}\text{--}3$ are software programmable. In Enhanced Mode, $\overline{\text{MCS0}}$ becomes a PEREQ input (Processor Extension Request). When connected to the Math Coprocessor, this input is used to signal the M80C186XL when to make numeric data transfers to and from the coprocessor. $\overline{\text{MCS3}}$ becomes $\overline{\text{NPS}}$ (Numeric Processor Select) which may only be activated by communication to the 80C187. $\overline{\text{MCS1}}$ becomes $\overline{\text{ERROR}}$ in Enhanced Mode and is used to signal numerics coprocessor errors. $\overline{\text{MCS0}}/\overline{\text{PEREQ}}$ and $\overline{\text{MCS1}}/\overline{\text{ERROR}}$ have weak internal pullups which are active during reset.
$\overline{\text{PCS0}}$ $\overline{\text{PCS1}}$ $\overline{\text{PCS2}}$ $\overline{\text{PCS3}}$ $\overline{\text{PCS4}}$	25 27 28 29 30	O O O O O	Peripheral Chip Select signals 0–4 are active LOW when a reference is made to the defined peripheral area (64K byte I/O or 1 MByte memory space). These lines do not float during bus HOLD. The address ranges activating $\overline{\text{PCS0}}\text{--}4$ are software programmable.
$\overline{\text{PCS5}}/\text{A1}$	31	O	Peripheral Chip Select 5 or Latched A1 may be programmed to provide a sixth peripheral chip select, or to provide an internally latched A1 signal. The address range activating $\overline{\text{PCS5}}$ is software-programmable. $\overline{\text{PCS5}}/\text{A1}$ does not float during bus HOLD. When programmed to provide latched A1, this pin will retain the previously latched value during HOLD.
$\overline{\text{PCS6}}/\text{A2}$	32	O	Peripheral Chip Select 6 or Latched A2 may be programmed to provide a seventh peripheral chip select, or to provide an internally latched A2 signal. The address range activating $\overline{\text{PCS6}}$ is software-programmable. $\overline{\text{PCS6}}/\text{A2}$ does not float during bus HOLD. When programmed to provide latched A2, this pin will retain the previously latched value during HOLD.
$\text{DT}/\overline{\text{R}}$	40	O	Data Transmit/Receive controls the direction of data flow through an external data bus transceiver. When LOW, data is transferred to the M80C186XL. When HIGH the M80C186XL places write data on the data bus. $\text{DT}/\overline{\text{R}}$ floats during a bus hold or reset.
$\overline{\text{DEN}}$	39	O	Data Enable is provided as a data bus transceiver output enable. $\overline{\text{DEN}}$ is active LOW during each memory and I/O access (including 80C187 access). $\overline{\text{DEN}}$ is HIGH whenever $\text{DT}/\overline{\text{R}}$ changes state. During RESET, $\overline{\text{DEN}}$ is driven HIGH for one clock, then floated. $\overline{\text{DEN}}$ also floats during HOLD.
N.C.	—	—	Not connected. To maintain compatibility with future products, do not connect to these pins.

Figure 3. M80C186XL Oscillator Configurations (see text)

INTRODUCTION

The following Functional Description describes the base architecture of the M80C186XL. The M80C186XL is a very high integration 16-bit microprocessor. It combines 15–20 of the most common microprocessor system components onto one chip. The M80C186XL is object code compatible with the 8086/8088 microprocessors and adds 10 new instruction types to the 8086/8088 instruction set.

The M80C186XL has two major modes of operation, Compatible and Enhanced. In Compatible Mode the M80C186XL is completely compatible with NMOS 80186, with the exception of 8087 support. The Enhanced mode adds three new features to the system design. These are Power-Save control, Dynamic RAM refresh, and an asynchronous Numerics Co-processor interface.

M80C186XL BASE ARCHITECTURE

M80C186XL Clock Generator

The M80C186XL provides an on-chip clock generator for both internal and external clock generation. The clock generator features a crystal oscillator, a divide-by-two counter, synchronous and asynchronous ready inputs, and reset circuitry.

The M80C186XL oscillator circuit is designed to be used either with a parallel resonant fundamental or

third-overtone mode crystal, depending upon the frequency range of the application. This is used as the time base for the M80C186XL.

The output of the oscillator is not directly available outside the M80C186XL. The recommended crystal configuration is shown in Figure 3b. When used in third-overtone mode, the tank circuit is recommended for stable operation. Alternately, the oscillator may be driven from an external source as shown in Figure 3a.

The crystal or clock frequency chosen must be twice the required processor operating frequency due to the internal divide by two counter. This counter is used to drive all internal phase clocks and the external CLKOUT signal. CLKOUT is a 50% duty cycle processor clock and can be used to drive other system components. All AC Timings are referenced to CLKOUT.

Intel recommends the following values for crystal selection parameters.

Temperature Range:	Application Specific
ESR (Equivalent Series Resistance):	60 Ω max
C_0 (Shunt Capacitance of Crystal):	7.0 pF max
C_1 (Load Capacitance):	20 pF \pm 5 pF
Drive Level:	2 mW max

Bus Interface Unit

The M80C186XL provides a local bus controller to generate the local bus control signals. In addition, it employs a HOLD/HLDA protocol for relinquishing the local bus to other bus masters. It also provides outputs that can be used to enable external buffers and to direct the flow of data on and off the local bus.

The bus controller is responsible for generating 20 bits of address, read and write strobes, bus cycle status information and data (for write operations) information. It is also responsible for reading data from the local bus during a read operation. Synchronous and asynchronous ready input pins are provided to extend a bus cycle beyond the minimum four states (clocks).

The M80C186XL bus controller also generates two control signals (\overline{DEN} and $\overline{DT/\overline{R}}$) when interfacing to external transceiver chips. This capability allows the addition of transceivers for simple buffering of the multiplexed address/data bus.

During RESET the local bus controller will perform the following action:

- Drive \overline{DEN} , \overline{RD} and \overline{WR} HIGH for one clock cycle, then float them.
- Drive $\overline{S0}-\overline{S2}$ to the inactive state (all HIGH) and then float.
- Drive \overline{LOCK} HIGH and then float.
- Float $AD0-15$, $A16-19$, \overline{BHE} , $\overline{DT/\overline{R}}$.
- Drive ALE LOW
- Drive HLDA LOW.

$\overline{RD}/\overline{QSMD}$, \overline{UCS} , \overline{LCS} , $\overline{MCS0}/\overline{PEREQ}$, $\overline{MCS1}/\overline{ERROR}$ and $\overline{TEST}/\overline{BUSY}$ pins have internal pullup devices which are active while \overline{RES} is applied. Excessive loading or grounding certain of these pins causes the M80C186XL to enter an alternative mode of operation:

- $\overline{RD}/\overline{QSMD}$ low results in Queue Status Mode.
- \overline{UCS} and \overline{LCS} low results in ONCE Mode.
- $\overline{TEST}/\overline{BUSY}$ low (and high later) results in Enhanced Mode.

M80C186XL PERIPHERAL ARCHITECTURE

All the M80C186XL integrated peripherals are controlled by 16-bit registers contained within an internal 256-byte control block. The control block may be mapped into either memory or I/O space. Internal logic will recognize control block addresses and respond to bus cycles. An offset map of the 256-byte control register block is shown in Figure 4.

ADVANCE INFORMATION

Chip-Select/Ready Generation Logic

The M80C186XL contains logic which provides programmable chip-select generation for both memories and peripherals. In addition, it can be programmed to provide READY (or WAIT state) generation. It can also provide latched address bits A1 and A2. The chip-select lines are active for all memory and I/O cycles in their programmed areas, whether they be generated by the CPU or by the integrated DMA unit.

The M80C186XL provides 6 memory chip select outputs for 3 address areas; upper memory, lower memory, and midrange memory. One each is provided for upper memory and lower memory, while four are provided for midrange memory.

	OFFSET
Relocation Register	FEH
DMA Descriptors Channel 1	DAH
	D0H
DMA Descriptors Channel 0	CAH
	C0H
Chip-Select Control Registers	A8H
	A0H
Time 2 Control Registers	66H
	60H
Time 1 Control Registers	5EH
	58H
Time 0 Control Registers	56H
	50H
Interrupt Controller Registers	3EH
	20H

Figure 4. Internal Register Map

The M80C186XL provides a chip select, called \overline{UCS} , for the top of memory. The top of memory is usually used as the system memory because after reset the M80C186XL begins executing at memory location FFFF0H.

The M80C186XL provides a chip select for low memory called $\overline{\text{LCS}}$. The bottom of memory contains the interrupt vector table, starting at location 00000H.

The M80C186XL provides four $\overline{\text{MCS}}$ lines which are active within a user-locatable memory block. This block can be located within the M80C186XL 1 Mbyte memory address space exclusive of the areas defined by $\overline{\text{UCS}}$ and $\overline{\text{LCS}}$. Both the base address and size of this memory block are programmable.

The M80C186XL can generate chip selects for up to seven peripheral devices. These chip selects are active for seven contiguous blocks of 128 bytes above a programmable base address. The base address may be located in either memory or I/O space.

The M80C186XL can generate a READY signal internally for each of the memory or peripheral $\overline{\text{CS}}$ lines. The number of WAIT states to be inserted for each peripheral or memory is programmable to provide 0–3 wait states for all accesses to the area for which the chip select is active. In addition, the M80C186XL may be programmed to either ignore external READY for each chip-select range individually or to factor external READY with the integrated ready generator.

Upon RESET, the Chip-Select/Ready Logic will perform the following actions:

- All chip-select outputs will be driven HIGH.
- Upon leaving RESET, the $\overline{\text{UCS}}$ line will be programmed to provide chip selects to a 1K block with the accompanying READY control bits set at 011 to insert 3 wait states in conjunction with external READY (i.e., UMCS resets to FFFBH).
- No other chip select or READY control registers have any predefined values after RESET. They will not become active until the CPU accesses their control registers.

DMA Unit

The M80C186XL DMA controller provides two independent high-speed DMA channels. Data transfers can occur between memory and I/O spaces (e.g., Memory to I/O) or within the same space (e.g., Memory to Memory or I/O to I/O). Data can be transferred either in bytes (8 bits) or in words (16 bits) to or from even or odd addresses. Each DMA channel maintains both a 20-bit source and destination pointer which can be optionally incremented or decremented after each data transfer (by one or two depending on byte or word transfers). Each data transfer consumes 2 bus cycles (a minimum of 8 clocks), one cycle to fetch data and the other to store data.

Timer/Counter Unit

The M80C186XL provides three internal 16-bit programmable timers. Two of these are highly flexible and are connected to four external pins (2 per timer). They can be used to count external events, time external events, generate nonrepetitive waveforms, etc. The third timer is not connected to any external pins, and is useful for real-time coding and time delay applications. In addition, the third timer can be used as a prescaler to the other two, or as a DMA request source.

Interrupt Control Unit

The M80C186XL can receive interrupts from a number of sources, both internal and external. The M80C186XL has 5 external and 2 internal interrupt sources (Timer/Counters and DMA). The internal interrupt controller serves to merge these requests on a priority basis, for individual service by the CPU.

Enhanced Mode Operation

In Compatible Mode the M80C186XL operates with all the features of the NMOS 80186, with the exception of 8087 support (i.e. no math coprocessing is possible in Compatible Mode). Queue-Status information is still available for design purposes other than 8087 support.

All the Enhanced Mode features are completely masked when in Compatible Mode. A write to any of the Enhanced Mode registers will have no effect, while a read will not return any valid data.

In Enhanced Mode, the M80C186XL will operate with Power-Save, DRAM refresh, and numerics coprocessor support in addition to all the Compatible Mode features.

If connected to a math coprocessor, this mode will be invoked automatically. Without an NPX, this mode can be entered by tying the RESET output signal from the M80C186XL to the $\overline{\text{TEST}}/\overline{\text{BUSY}}$ input.

Queue-Status Mode

The queue-status mode is entered by strapping the $\overline{\text{RD}}$ pin low. $\overline{\text{RD}}$ is sampled at RESET and if LOW, the M80C186XL will reconfigure the ALE and $\overline{\text{WR}}$ pins to be QS0 and QS1 respectively. This mode is available on the M80C186XL in both Compatible and Enhanced Modes.

DRAM Refresh Control Unit

The Refresh Control Unit (RCU) automatically generates DRAM refresh bus cycles. The RCU operates only in Enhanced Mode. After a programmable period of time, the RCU generates a memory read request to the BIU. If the address generated during a refresh bus cycle is within the range of a properly programmed chip select, that chip select will be activated when the BIU executes the refresh bus cycle.

Power-Save Control

The M80C186XL, when in Enhanced Mode, can enter a power saving state by internally dividing the processor clock frequency by a programmable factor. This divided frequency is also available at the CLKOUT pin.

All internal logic, including the Refresh Control Unit and the timers, have their clocks slowed down by the division factor. To maintain a real time count or a fixed DRAM refresh rate, these peripherals must be re-programmed when entering and leaving the power-save mode.

Interface for 80C187 Math Coprocessor

In Enhanced Mode, three of the mid-range memory chip selects are redefined according to Table 2 for use with the 80C187. The fourth chip select, $\overline{MCS2}$ functions as in compatible mode, and may be pro-

grammed for activity with ready logic and wait states accordingly. As in Compatible Mode, $\overline{MCS2}$ will function for one-fourth a programmed block size.

Table 2. \overline{MCS} Assignments

Compatible Mode	Enhanced Mode
$\overline{MCS0}$	PEREQ Processor Extension Request
$\overline{MCS1}$	ERROR NPX Error
$\overline{MCS2}$	$\overline{MCS2}$ Mid-Range Chip Select
$\overline{MCS3}$	NPS Numeric Processor Select

ONCE Test Mode

To facilitate testing and inspection of devices when fixed into a target system, the M80C186XL has a test mode available which allows all pins to be placed in a high-impedance state. ONCE stands for "ON Circuit Emulation". When placed in this mode, the M80C186XL will put all pins in the high-impedance state until RESET.

The ONCE mode is selected by tying the \overline{UCS} and the \overline{LCS} LOW during RESET. These pins are sampled on the low-to-high transition of the \overline{RES} pin. The \overline{UCS} and the \overline{LCS} pins have weak internal pull-up resistors similar to the \overline{RD} and $\overline{TEST}/\overline{BUSY}$ pins to guarantee ONCE Mode is not entered inadvertently during normal operation. \overline{LCS} and \overline{UCS} must be held low at least one clock after \overline{RES} goes high to guarantee entrance into ONCE Mode.

ABSOLUTE MAXIMUM RATINGS*

Case Temperature under Bias . . . -55°C to $+125^{\circ}\text{C}$
 Storage Temperature -65°C to $+150^{\circ}\text{C}$
 Voltage on Any Pin with
 Respect to Ground -1.0V to $+7.0\text{V}$
 /Package Power Dissipation 1W
 Not to exceed the maximum allowable die temperature based on thermal resistance of the package.

NOTICE: This data sheet contains information on products in the sampling and initial production phases of development. It is valid for the devices indicated in the revision history. The specifications are subject to change without notice.

**WARNING: Stressing the device beyond the "Absolute Maximum Ratings" may cause permanent damage. These are stress ratings only. Operation beyond the "Operating Conditions" is not recommended and extended exposure beyond the "Operating Conditions" may affect device reliability.*

NOTICE: The specifications are subject to change without notice.

DC CHARACTERISTICS $T_C = -55^{\circ}\text{C}$ to $+125^{\circ}\text{C}$, $V_{CC} = 5\text{V} \pm 10\%$

Symbol	Parameter	Min	Max	Units	Test Conditions
V_{IL}	Input Low Voltage (Except X1)	-0.5	$0.2 V_{CC} - 0.3$	V	
V_{IL1}	Clock Input Low Voltage (X1)	-0.5	0.6	V	
V_{IH}	Input High Voltage (All except X1 and $\overline{\text{RES}}$)	$0.2 V_{CC} + 0.9$	$V_{CC} + 0.5$	V	
V_{IH1}	Input High Voltage ($\overline{\text{RES}}$)	3.0	$V_{CC} + 0.5$	V	
V_{IH2}	Clock Input High Voltage (X1)	3.9	$V_{CC} + 0.5$	V	
V_{OL}	Output Low Voltage		0.45	V	$I_{OL} = 2.5 \text{ mA}$ (S0, 1, 2) $I_{OL} = 2.0 \text{ mA}$ (others)

		$V_{CC} - 0.5$	V_{CC}	V	$I_{OH} = -200 \mu\text{A}$ @ $V_{CC} - 0.5$ (4)
I_{CC}	Power Supply Current		100	mA	@ 20 MHz , -55°C $V_{CC} = 5.5\text{V}$ (3)
			90	mA	@ 16 MHz , -55°C $V_{CC} = 5.5\text{V}$ (3)
			80	mA	@ 12.5 MHz , -55°C $V_{CC} = 5.5\text{V}$ (3)
			70	mA	@ 10 MHz , -55°C $V_{CC} = 5.5\text{V}$ (3)
I_{LI}	Input Leakage Current		± 10	μA	@ 0.5 MHz , $0.45\text{V} \leq V_{IN} \leq V_{CC}$
I_{LO}	Output Leakage Current		± 10	μA	@ 0.5 MHz , $0.45\text{V} \leq V_{OUT} \leq V_{CC}$ (1)
V_{CLO}	Clock Output Low		0.45	V	$I_{CLO} = 4.0 \text{ mA}$

DC CHARACTERISTICS (Continued) $T_C = -55^\circ\text{C}$ to $+125^\circ\text{C}$, $V_{CC} = 5\text{V} \pm 10\%$

Symbol	Parameter	Min	Max	Units	Test Conditions
V_{CHO}	Clock Output High	$V_{CC} - 0.5$		V	$I_{CHO} = -500 \mu\text{A}$
C_{IN}	Input Capacitance		10	pF	@ 1 MHz ⁽²⁾
C_{IO}	Output or I/O Capacitance		20	pF	@ 1 MHz ⁽²⁾

NOTES:

1. Pins being floated during HOLD or by invoking the ONCE Mode.
2. Characterization conditions are a) Frequency = 1 MHz; b) Unmeasured pins at GND; c) V_{IN} at + 5.0V or 0.45V. This parameter is not tested.
3. Current is measured with the device in RESET with X1 and X2 driven and all other non-power pins open.
4. $\overline{RD}/\overline{QSMD}$, UCS, LCS, MCS0/PEREQ, MCS1/ERROR and $\overline{TEST}/\overline{BUSY}$ pins have internal pullup devices. Loading some of these pins above $I_{OH} = -200 \mu\text{A}$ can cause the M80C186XL to go into alternative modes of operation. See the section on Local Bus Controller and Reset for details.

AC CHARACTERISTICS

MAJOR CYCLE TIMINGS (READ CYCLE)

$T_C = -55^\circ\text{C}$ to $+125^\circ\text{C}$, $V_{CC} = 5V \pm 10\%$

All timings are measured at 1.5V and 100 pF loading on CLKOUT unless otherwise noted.

All output test conditions are with $C_L = 50$ pF.

For AC tests, input $V_{IL} = 0.45V$ and $V_{IH} = 2.4V$ except at X1 where $V_{IH} = V_{CC} - 0.5V$.

AC CHARACTERISTICS

SOFTWARE HALT CYCLE TIMINGS

$T_C = -55^\circ\text{C}$ to $+125^\circ\text{C}$, $V_{CC} = 5V \pm 10\%$

All timings are measured at 1.5V and 100 pF loading on CLKOUT unless otherwise noted.

All output test conditions are with $C_L = 50$ pF.

For AC tests, input $V_{IL} = 0.45V$ and $V_{IH} = 2.4V$ except at X1 where $V_{IH} = V_{CC} - 0.5V$.

EXPLANATION OF THE AC SYMBOLS

Each timing symbol has from 5 to 7 characters. The first character is always a 'T' (stands for time). The other characters, depending on their positions, stand for the name of a signal or the logical status of that signal. The following is a list of all the characters and what they stand for.

A: Address
 ARY: Asynchronous Ready Input
 C: Clock Output
 CK: Clock Input
 CS: Chip Select
 CT: Control (DT/ \overline{R} , \overline{DEN} , . . .)
 D: Data Input
 DE: \overline{DEN}
 H: Logic Level High
 OUT: Input (DRQ0, TIM0, . . .)
 L: Logic Level Low or ALE
 O: Output
 QS: Queue Status (QS1, QS2)
 R: \overline{RD} Signal, RESET Signal
 S: Status ($\overline{S0}$, $\overline{S1}$, $\overline{S2}$)
 SRY: Synchronous Ready Input
 V: Valid
 W: WR Signal
 X: No Longer a Valid Logic Level
 Z: Float

Examples:

T_{CLAV} — Time from Clock low to Address valid
 T_{CHLH} — Time from Clock high to ALE high
 T_{CLCSV} — Time from Clock low to Chip Select valid

M80C186XL EXECUTION TIMINGS

A determination of M80C186XL program execution timing must consider the bus cycles necessary to prefetch instructions as well as the number of execution unit cycles necessary to execute instructions. The following instruction timings represent the minimum execution time in clock cycles for each instruction. The timings given are based on the following assumptions:

- The opcode, along with any data or displacement required for execution of a particular instruction, has been prefetched and resides in the queue at the time it is needed.
- No wait states or bus HOLDs occur.
- All word-data is located on even-address boundaries.

All jumps and calls include the time required to fetch the opcode of the next instruction at the destination address.

All instructions which involve memory accesses can require one or two additional clocks above the minimum timings shown due to the asynchronous handshake between the bus interface unit (BIU) and execution unit.

With a 16-bit BIU, the M80C186XL has sufficient bus performance to ensure that an adequate number of prefetched bytes will reside in the queue most of the time. Therefore, actual program execution time will not be substantially greater than that derived from adding the instruction timings shown.

INSTRUCTION SET SUMMARY

NOP = No Operation	1 0 0 1 0 0 0 0	3	
(TTT LLL are opcode to processor extension)			

Shaded areas indicate instructions not available in 8086/8088 microsystems.

FOOTNOTES

The Effective Address (EA) of the memory operand is computed according to the mod and r/m fields:

- if mod = 11 then r/m is treated as a REG field
- if mod = 00 then DISP = 0*, disp-low and disp-high are absent
- if mod = 01 then DISP = disp-low sign-extended to 16-bits, disp-high is absent
- if mod = 10 then DISP = disp-high: disp-low
- if r/m = 000 then EA = (BX) + (SI) + DISP
- if r/m = 001 then EA = (BX) + (DI) + DISP
- if r/m = 010 then EA = (BP) + (SI) + DISP
- if r/m = 011 then EA = (BP) + (DI) + DISP
- if r/m = 100 then EA = (SI) + DISP
- if r/m = 101 then EA = (DI) + DISP
- if r/m = 110 then EA = (BP) + DISP*
- if r/m = 111 then EA = (BX) + DISP

DISP follows 2nd byte of instruction (before data if required)

*except if mod = 00 and r/m = 110 then EA = disp-high: disp-low.

EA calculation time is 4 clock cycles for all modes, and is included in the execution times given whenever appropriate.

Segment Override Prefix

0	0	1	reg	1	1	0
---	---	---	-----	---	---	---

reg is assigned according to the following:

reg	Segment Register
00	ES
01	CS
10	SS
11	DS

REG is assigned according to the following table:

16-Bit (w = 1)	8-Bit (w = 0)
000 AX	000 AL
001 CX	001 CL
010 DX	010 DL
011 BX	011 BL
100 SP	100 AH
101 BP	101 CH
110 SI	110 DH
111 DI	111 BH

The physical addresses of all operands addressed by the BP register are computed using the SS segment register. The physical addresses of the destination operands of the string primitive operations (those addressed by the DI register) are computed using the ES segment, which may not be overridden.
