

MAAPGM0072-DIE Rev B Preliminary Datasheet

Features

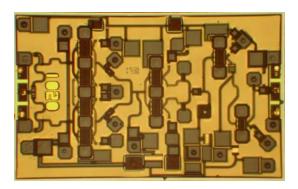

- ◆ 1 Watt Saturated Output Power Level
- ♦ Variable Drain Voltage (4-10V) Operation
- ♦ MSAG[®] Process

Description

The MAAPGM0072-DIE is a 4-stage 1 W power amplifier with on-chip bias networks. This product is fully matched to 50 ohms on both the input and output. It can be used as a power amplifier stage or as a driver stage in high power applications.

Fabricated using M/A-COM's repeatable, high performance and highly reliable GaAs Multifunction Self-Aligned Gate (MSAG™)Process, each device is 100% RF tested on wafer to ensure performance compliance.

M/A-COM's MSAG™ process features robust silicon-like manufacturing processes, planar processing of ion implanted transistors, multiple implant capability enabling power, low-noise, switch and digital FETs on a single chip, and polyimide scratch protection for ease of use with automated manufacturing processes. The use of refractory metals and the absence of platinum in the gate metal formulation prevents hydrogen poisoning when employed in hermetic packaging.

Primary Applications

- ♦ Point-to-Point Radios
 - ♦ 18 GHz Band

Operating Instructions

This device is static sensitive. Please handle with care. To operate the device, follow these steps.

- 1. Apply $V_{GG} = -2.7 \text{ V}, V_{DD} = 0 \text{ V}.$
- 2. Ramp V_{DD} to desired voltage, typically 8.0 V.
- 3. Adjust V_{GG} to set I_{DQ} , (approximately @ -2.0 V).
- 4. Set RF input.
- 5. Power down sequence in reverse. Turn V_{GG} off last

Die Handling:

Refer to Application Note AN3016.

Assembly Instructions:

Die Attach: Use AuSn (80/20) 1 mil. preform solder. Limit time @ 310 °C to less than 7 minutes. Refer to Application Note AN3017 for more detailed information.

Wirebonding: Bond @ 160 °C using standard ball or thermal compression wedge bond techniques. For DC pad connections, use either ball or wedge bonds. For best RF performance, use wedge bonds of shortest length, although ball bonds are also acceptable.

Biasing Note: Must apply negative bias to V_{GG} before applying positive bias to V_{DD} to prevent damage to amplifier.
