## FUNCTIONAL DESCRIPTIONS

## SERIAL DATA INPUT

Serial data input is achieved by three inputs, such as Data pin, Clock pin and LE pin. Serial data input controls 15-bit programmable reference divider and 18-bit programmable divider, respectively.

Binary serial data is input to Data pin.
On rising edge of clock shifts one bit of serial data into the internal shift registers and when load enable pin is high level or open, stored data is transferred into latch depending upon the control bit.

Control data " H " data is transferred into 15 -bit latch.
Control data "L" data is transferred into 18-bit latch.

## PROGRAMMABLE REFERENCE DIVIDER

Programmable reference divider consists of 16 -bit shift register, 15 -bit latch and 14-bit reference counter. Serial 16-bit data format is shown below.

## PHASE CHARACTERISTICS

FC pin is provided to change phase characteristics of phase comparator. Characteristics of internal charge pump output level $\left(D_{0}\right)$, phase comparator output level ( $\varnothing \mathrm{R}, \varnothing \mathrm{P}$ ) are reversed depending upon FC pin input level. Also, monitor pin (fout) output level of phase comparator is controlled by FC pin input level. The relation between outputs ( $D_{\mathrm{O}}, \varnothing \mathrm{R}, \varnothing \mathrm{P}$ ) and FC input level are shown below.

|  | FC=H or open |  |  |  | FC=L |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  | H | L | L | $\left(\mathrm{f}_{\mathrm{r}}\right)$ | L | H | Z | $\left(\mathrm{f}_{\mathrm{p}}\right)$ |
| $\mathrm{f}_{\mathrm{r}}<\mathrm{f}_{\mathrm{p}}$ | L | H | Z | $\left(\mathrm{f}_{\mathrm{r}}\right)$ | H | L | L | $\left(\mathrm{f}_{\mathrm{p}}\right)$ |
| $\mathrm{f}_{\mathrm{r}}=\mathrm{f}_{\mathrm{p}}$ | Z | L | Z | $\left(\mathrm{f}_{\mathrm{r}}\right)$ | Z | L | Z | $\left(\mathrm{f}_{\mathrm{p}}\right)$ |

Note: $\quad Z=($ High impedance $)$

VCO CHARACTERISTICS
Depending upon VCO characteristics, FC pin should be set accordingly:

- When VCO characteristics are like1 FC should be set High or open circuit;
- When VCO characteristics are like 2 , FC should be set Low.

NOTES: Phase difference detection range: $-2 \pi$ to $+2 \pi$
Spike appearance depends on charge pump characteristics. Also, the spike is output in order to diminish dead band.
When $f_{r}>f_{p}$ or $f_{r}<f_{p}$, spike might not appear depending upon charge pump characteristics.

## ANALOG SWITCH

ON/OFF of analog switch is controlled by LE input signal. When the analog switch is ON , internal charge pump output ( $\mathrm{D}_{\mathrm{O}}$ ) to be connected to BISW pin. When the analog switch is OFF, BISW pin is set to high-impedance state.
$\mathrm{LE}=\mathrm{H}$ (Changing the divide ratio of internal prescaler) : Analog switch=ON
LE=L (Normal operating mode): Analog switch=OFF
LPF time constant is decreased in order to insert a analog switch between LPF1 and LPF2 when channel of PLL is changing.
Thus, lock up time is decreased, that is, fast lock up time is achieved.
