

The MB90350-series with 1 channel FULL-CAN interface and Flash ROM is especially designed for automotive and industrial applications. Its main feature is the on-board CAN interface, which conforms to V2.0 Part A and Part B, while supporting a very flexible message buffer scheme and so offering more functions than a normal full CAN approach. With the new 0.35 μm CMOS technology, Cypress now offers on-chip Flash-ROM program memory up to 128 Kbytes.

The power supply (3 V) is supplied to the internal MCU core from an internal regulator circuit. This creates a major advantage in terms of EMI and power consumption.

The internal PLL clock frequency multiplier provides an internal 42 ns instruction execution time from an external 4 MHz clock. Also, the clock monitor function can monitor main clock and sub clock independently.

As the peripheral resources, the unit features a 4-channel Output Compare Unit, 6-channel Input Capture Unit, 2 separate 16-bit freerun timers, 2-channel UART and 15-channel 8/10-bit A/D converter.

## Features

### Clock

- Built-in PLL clock frequency multiplication circuit
- Selection of machine clocks (PLL clocks) is allowed among frequency division by two on oscillation clock, and multiplication of 1 to 6 times of oscillation clock (for 4 MHz oscillation clock, 4 MHz to 24 MHz).
- Operation by sub clock (up to 50 kHz : 100 kHz oscillation clock divided by two) is allowed. (devices without S-suffix only)
- Minimum execution time of instruction : 42 ns (when operating with 4-MHz oscillation clock, and 6-time multiplied PLL clock).
- Built-in clock modulation circuit

### 16 Mbytes CPU memory space

- 24-bit internal addressing

### Clock monitor function (MB90x356x and MB90x357x only)

- Main clock or sub clock is monitored independently.
- Internal CR oscillation clock (100 kHz typical) can be used as sub clock.

### Instruction system best suited to controller

- Wide choice of data types (bit, byte, word, and long word)
- Wide choice of addressing modes (23 types)
- Enhanced multiply-divide instructions with sign and RETI instructions
- Enhanced high-precision computing with 32-bit accumulator

### Instruction system compatible with high-level language (C language) and multitask

- Employing system stack pointer
- Enhanced various pointer indirect instructions
- Barrel shift instructions

### Increased processing speed

- 4-byte instruction queue

### Powerful interrupt function

- Powerful 8-level, 34-condition interrupt feature
- Up to 8 channels external interrupts are supported.

### Automatic data transfer function independent of CPU

- Extended intelligent I/O service function (EI<sup>2</sup>OS) : up to 16 channels
- DMA: up to 16 channels

### Low power consumption (standby) mode

- Sleep mode (a mode that halts CPU operating clock)
- Main timer mode (a timebase timer mode switched from the main clock mode)
- PLL timer mode (a timebase timer mode switched from the PLL clock mode)
- Watch mode (a mode that operates sub clock and watch timer only)
- Stop mode (a mode that stops oscillation clock and sub clock)
- CPU intermittent operation mode

### Process

- CMOS technology

### I/O port

- General-purpose input/output port (CMOS output)
  - 49 ports (devices without S-suffix : devices that correspond to sub clock)
  - 51 ports (devices with S-suffix : devices that do not correspond to sub clock)

**Sub clock pin (X0A, X1A)**

- Yes (using the external oscillation) : devices without S-suffix
- No (using the sub clock mode at internal CR oscillation) : devices with S-suffix

**Timer**

- Timebase timer, watch timer, watchdog timer: 1 channel
- 8/16-bit PPG timer: 8-bit × 10 channels or 16-bit × 6 channels
- 16-bit reload timer: 4 channels
- 16-bit input/output timer
  - 16-bit freerun timer : 2 channels (FRT0: ICU0/1, FRT1: ICU 4/5/6/7, OCU 4/5/6/7)
  - 16-bit input capture: (ICU): 6 channels
  - 16-bit output compare: (OCU): 4 channels

**FULL-CAN interface 1 channel**

- Compliant with Ver2.0 part A and Ver2.0 part B CAN specifications
- Flexible message buffering (mailbox and FIFO buffering can be mixed)
- CAN wake-up function

**UART (LIN/SCI): 2 channels**

- Equipped with full-duplex double buffer
- Clock-asynchronous or clock-synchronous serial transmission is available.

**I<sup>2</sup>C interface: 1 channel**

- Up to 400 Kbit/s transfer rate

**DTP/External interrupt: 8 channels, CAN wakeup: 1 channel**

- Module for activation of extended intelligent I/O service (E<sup>2</sup>OS), DMA, and generation of external interrupt by external input.

**Delay interrupt generator module**

- Generates interrupt request for task switching.

**8/10-bit A/D converter: 15 channels**

- Resolution is selectable between 8-bit and 10-bit.
- Activation by external trigger input is allowed.
- Conversion time: 3 μs (at 24-MHz machine clock, including sampling time)

**Program patch function**

- Address matching detection for 6 address pointers.

**Capable of changing input voltage level for port**

- Automotive/CMOS-Schmitt (initial level is Automotive in single chip mode)
- TTL level (corresponds to external bus pins only, initial level of these pins is TTL in external bus mode)

**Low voltage/CPU operation detection reset (devices with T-suffix)**

- Detects low voltage (4.0 V ± 0.3 V) and resets automatically
- Resets automatically when program is runaway and counter is not cleared within interval time (approx. 262 ms : external 4 MHz)

**Dual operation flash memory (only flash memory devices with A-suffix)**

- Erase/write and read can be executed in the different bank (Upper Bank/Lower Bank) at the same time.

**Models that support + 125 °C**

- Devices without A-suffix (excluding evaluation device) : The maximum operating frequency is 16 MHz (at T<sub>A</sub> = +125 °C) .
- Devices with A-suffix (excluding evaluation device) : The maximum operating frequency is 24 MHz (at T<sub>A</sub> = +125 °C) .

**Flash security function**

- Protects the content of Flash memory (MB90F352x and MB90F357x only)

**External bus interface**

- 4 Mbytes external memory space

16-bit Input Capture	6 channels				8 channels	
	Retains freerun timer value by (rising edge, falling edge or rising & falling edge), signals an interrupt.					
8/16-bit Programmable Pulse Generator	6 channels (16-bit)/10 channels (8-bit) 8-bit reload counters × 12 8-bit reload registers for L pulse width × 12 8-bit reload registers for H pulse width × 12				8 channels (16-bit)/16 channels (8-bit) 8-bit reload counters × 16 8-bit reload registers for L pulse width × 16 8-bit reload registers for H pulse width × 16	
	Supports 8-bit and 16-bit operation modes. A pair of 8-bit reload counters can be configured as one 16-bit reload counter or as 8-bit prescaler + 8-bit reload counter. Operation clock frequency : $f_{sys}$ , $f_{sys}/2^1$ , $f_{sys}/2^2$ , $f_{sys}/2^3$ , $f_{sys}/2^4$ or $128 \mu s @ f_{osc} = 4 \text{ MHz}$ ( $f_{sys}$ = Machine clock frequency, $f_{osc}$ = Oscillation clock frequency)					
CAN Interface	1 channel				3 channels	
	Conforms to CAN Specification Version 2.0 Part A and B. Automatic re-transmission in case of error Automatic transmission responding to Remote Frame Prioritized 16 message buffers for data and ID Supports multiple messages. Flexible configuration of acceptance filtering : Full bit compare/Full bit mask/Two partial bit masks Supports up to 1 Mbps.					
External Interrupt	8 channels				16 channels	
	Can be used rising edge, falling edge, starting up by H/L level input, external interrupt, extended intelligent I/O services (EI <sup>2</sup> OS) and DMA.					
D/A converter	—				2 channels	
I/O Ports	Virtually all external pins can be used as general purpose I/O port. All push-pull outputs Bit-wise settable as input/output or peripheral module signal Settable as CMOS schmitt trigger/ automotive inputs TTL input level settable for external bus (only for external bus pin)

## 9. Handling Devices

**Special care is required for the following when handling the device :**

- Preventing latch-up
- Treatment of unused pins
- Using external clock
- Precautions for when not using a sub clock signal
- Notes on during operation of PLL clock mode
- Power supply pins ( $V_{CC}/V_{SS}$ )
- Pull-up/down resistors
- Crystal Oscillator Circuit
- Turning-on Sequence of Power Supply to A/D Converter and Analog Inputs
- Connection of Unused Pins of A/D Converter
- Notes on Energization
- Stabilization of power supply voltage
- Initialization
- Port0 to port3 output during Power-on (External-bus mode)
- Notes on using CAN Function
- Flash security Function
- Correspondence with  $T_A = +105\text{ }^\circ\text{C}$  or more
- Low voltage/CPU operation detection reset circuit
- Internal CR oscillation circuit

### 9.1 Preventing latch-up

CMOS IC chips may suffer latch-up under the following conditions :

- A voltage higher than  $V_{CC}$  or lower than  $V_{SS}$  is applied to an input or output pin.
- A voltage higher than the rated voltage is applied between  $V_{CC}$  pin and  $V_{SS}$  pin.
- The  $AV_{CC}$  power supply is applied before the  $V_{CC}$  voltage.

Latch-up may increase the power supply current drastically, causing thermal damage to the device.

In using the devices, take sufficient care to avoid exceeding maximum ratings.

For the same reason, also be careful not to let the analog power-supply voltage ( $AV_{CC}$ ,  $AVRH$ ) exceed the digital power-supply voltage.

### 9.2 Handling unused pins

Leaving unused input pins open may result in misbehavior or latch up and possible permanent damage of the device. Therefore they must be pulled up or pulled down through resistors. In this case those resistors should be more than 2 k $\Omega$ .

Unused I/O pins should be set to the output state and can be left open, or the input state with the above described connection.

### 9.3 Using external clock

To use external clock, drive the X0 pin and leave X1 pin open.

### 9.4 Precautions for when not using a sub clock signal

If you do not connect pins X0A and X1A to an oscillator, use pull-down handling on the X0A pin, and leave the X1A pin open.

### 9.5 Notes on during operation of PLL clock mode

If the PLL clock mode is selected, the microcontroller attempts to be working with the self-oscillating circuit even when there is no external oscillator or external clock input is stopped. Performance of this operation, however, cannot be guaranteed.

### 9.6 Power supply pins ( $V_{CC}/V_{SS}$ )

- If there are multiple  $V_{CC}$  and  $V_{SS}$  pins, from the point of view of device design, pins to be of the same potential are connected inside of the device to prevent such malfunctioning as latch up.  
To reduce unnecessary radiation, prevent malfunctioning of the strobe signal due to the rise of ground level, and observe the standard for total output current, be sure to connect the  $V_{CC}$  and  $V_{SS}$  pins to the power supply and ground externally.  
Connect  $V_{CC}$  and  $V_{SS}$  pins to the device from the current supply source at a low impedance.
- As a measure against power supply noise, connect a capacitor of about 0.1  $\mu\text{F}$  as a bypass capacitor between  $V_{CC}$  and  $V_{SS}$  pins in the vicinity of  $V_{CC}$  and  $V_{SS}$  pins of the device.

### 9.7 Pull-up/down resistors

The MB90350 series does not support internal pull-up/down resistors (Port 0 to Port 3: built-in pull-up resistors). Use external components where needed.

### 9.8 Crystal Oscillator Circuit

Noises around X0 or X1 pins may be possible causes of abnormal operations. Make sure to provide bypass capacitors via shortest distance from X0, X1 pins, crystal oscillator (or ceramic resonator) and ground lines, and make sure, to the utmost effort, that lines of oscillation circuit do not cross the lines of other circuits.

It is highly recommended to provide a printed circuit board artwork surrounding X0 and X1 pins with a ground area for stabilizing the operation.

Please ask the crystal maker to evaluate the oscillational characteristics of the crystal and this device.

### 9.9 Turning-on Sequence of Power Supply to A/D Converter and Analog Inputs

Make sure to turn on the A/D converter power supply ( $AV_{CC}$ ,  $AVRH$ ) and analog inputs ( $AN0$  to  $AN14$ ) after turning-on the digital power supply ( $V_{CC}$ ).

Turn-off the digital power after turning off the A/D converter power supply and analog inputs. In this case, make sure that the voltage does not exceed  $AVRH$  or  $AV_{CC}$  (turning on/off the analog and digital power supplies simultaneously is acceptable).

### 9.10 Connection of Unused Pins of A/D Converter if A/D Converter is not used

Connect unused pins of A/D converter to  $AV_{CC} = V_{CC}$ ,  $AV_{SS} = AVRH = V_{SS}$ .

### 9.11 Notes on Energization

To prevent the internal regulator circuit from malfunctioning, set the voltage rise time during energization at 50  $\mu$ s or more (0.2 V to 2.7 V).

### 9.12 Stabilization of power supply voltage

A sudden change in the power supply voltage may cause the device to malfunction even within the specified  $V_{CC}$  power supply voltage operating range. Therefore, the  $V_{CC}$  power supply voltage should be stabilized.

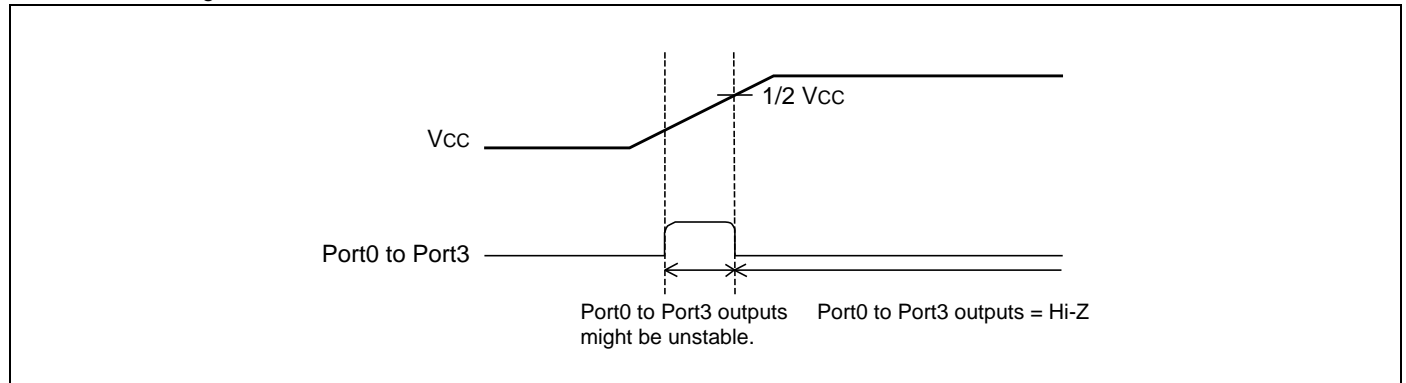

For reference, the power supply voltage should be controlled so that  $V_{CC}$  ripple variations (peak-to-peak value) at commercial frequencies (50 Hz to 60 Hz) fall below 10% of the standard  $V_{CC}$  power supply voltage and the coefficient of fluctuation does not exceed 0.1 V/ms at instantaneous power switching.

### 9.13 Initialization

In the device, there are internal registers which are initialized only by a power-on reset. To initialize these registers, turn on the power again.

### 9.14 Port 0 to port 3 output during Power-on (External-bus mode)

As shown below, when power is turned in external-bus mode, there is a possibility that output signal of Port 0 to Port 3 might be unstable.

### 9.15 Notes on using CAN Function

To use CAN function, please set "1" to DIRECT bit of CAN direct mode register (CDMR).

If DIRECT bit is set to "0" (initial value), wait states will be performed when accessing CAN registers.

**Note** : Please refer to section "22.15 CAN Direct Mode Register" in Hardware Manual of MB90350 series for detail of CAN direct mode register.

### 9.16 Flash security Function

The security byte is located in the area of the flash memory.

If protection code 01<sub>H</sub> is written in the security byte, the flash memory is in the protected state by security.

Therefore please do not write 01<sub>H</sub> in this address if you do not use the security function.

Please refer to following table for the address of the security byte.

	Flash memory size	Address for security bit
MB90F352(S) MB90F352A(S) MB90F352TA(S) MB90F357A(S) MB90F357TA(S)	Embedded 1 Mbit Flash Memory	FE0001 <sub>H</sub>

### 9.17 Correspondence with T<sub>A</sub> = +105 °C or more

If used exceeding T<sub>A</sub> = +105 °C, please contact sales representatives for reliability limitations.

### 9.18 Low voltage/CPU operation reset circuit

The low voltage detection reset circuit is a function that monitors power supply voltage in order to detect when a voltage drops below a given voltage level. When a low voltage condition is detected, an internal reset signal is generated.

The CPU operation detection reset circuit is a 20-bit counter that uses oscillation as a count clock and generates an internal reset signal if not cleared within a given time after startup.

#### 9.18.1 Low voltage detection reset circuit

Detection voltage
4.0 V ± 0.3 V

When a low voltage condition is detected, the low voltage detection flag (LVRC: LVRF) is set to “1” and an internal reset signal is output. Because the low voltage detection reset circuit continues to operate even in stop mode, detection of a low voltage condition generates an internal reset and releases stop mode.

During an internal RAM write cycle, low voltage reset is generated after the completion of writing. During the output of this internal reset, the reset output from the low voltage detection reset circuit is suppressed.

#### 9.18.2 CPU operation detection reset circuit

The CPU operation detection reset circuit is a counter that prevents program runaway. The counter starts automatically after a power-on reset, and must be continually cleared within a given time. If the given time interval elapses and the counter has not been cleared, a cause such as infinite program looping is assumed and an internal reset signal is generated. The internal reset generated from the CPU operation detection circuit has a width of 5 machine cycles.

Interval time
2 <sup>20</sup> /F <sub>C</sub> (approx. 262 ms*)

\* : This value assumes the interval time at an oscillation clock frequency of 4 MHz.

During recovery from standby mode, the detection period is the maximum interval plus 20 μs.

This circuit does not operate in modes where CPU operation is stopped.

The CPU operation detection reset circuit counter is cleared under any of the following conditions.

- “0” writing to CL bit of LVRC register
- Internal reset
- Main oscillation clock stop
- Transit to sleep mode
- Transit to timebase timer mode and watch mode

11. Memory Map

**Note :** The high-order portion of bank 00 gives the image of the FF bank ROM to make the small model of the C compiler effective. Since the low-order 16 bits are the same, the table in ROM can be referenced without using the far specification in the pointer declaration. For example, an attempt to access 00C000<sub>H</sub> accesses the value at FFC000<sub>H</sub> in ROM. The ROM area in bank FF exceeds 32 Kbytes, and its entire image cannot be shown in bank 00. The image between FF8000<sub>H</sub> and FFFFFF<sub>H</sub> is visible in bank 00, while the image between FF0000<sub>H</sub> and FF7FFF<sub>H</sub> is visible only in bank FF.

- Initial value of “X” represents unknown value.
- Any write access to reserved addresses in I/O map should not be performed. A read access to reserved addresses results reading “X”.

### 13. CAN Controllers

The CAN controller has the following features :

- Conforms to CAN Specification Version 2.0 Part A and B
  - Supports transmission/reception in standard frame and extended frame formats
- Supports transmitting of data frames by receiving remote frames
- 16 transmitting/receiving message buffers
  - 29-bit ID and 8-byte data
  - Multi-level message buffer configuration
- Provides full-bit comparison, full-bit mask, acceptance register 0/acceptance register 1 for each message buffer as ID acceptance mask
  - Two acceptance mask registers in either standard frame format or extended frame formats
- Bit rate programmable from 10 Kbps to 2 Mbps (when input clock is at 16 MHz)

Y2 : Usable, with EI<sup>2</sup>OS stop function

N : Unusable

**Notes :**

- The peripheral resources sharing the ICR register have the same interrupt level.
- When two peripheral resources share the ICR register, only one can use EI<sup>2</sup>OSat a time.
- When either of the two peripheral resources sharing the ICR register specifies EI<sup>2</sup>OS, the other one cannot use interrupts.

- \*1: This parameter is based on  $V_{SS} = AV_{SS} = 0\text{ V}$
- \*2: Set  $AV_{CC}$  and  $V_{CC}$  to the same voltage. Make sure that  $AV_{CC}$  does not exceed  $V_{CC}$  and that the voltage at the analog inputs does not exceed  $AV_{CC}$  when the power is switched on.
- \*3:  $V_I$  and  $V_O$  should not exceed  $V_{CC} + 0.3\text{ V}$ .  $V_I$  should not exceed the specified ratings. However if the maximum current to/from an input is limited by some means with external components, the  $I_{CLAMP}$  rating supersedes the  $V_I$  rating.
- \*4: Applicable to pins: P00 to P07, P10 to P17, P20 to P25, P30 to P37, P40 to P45, P50 to P56, P60 to P67
- \*5:
  - Applicable to pins: P00 to P07, P10 to P17, P20 to P25, P30 to P37, P40 to P45, P50 to P56 (for evaluation device : P50 to P55) , P60 to P67
  - Use within recommended operating conditions.
  - Use at DC voltage (current)
  - The +B signal should always be applied a limiting resistance placed between the +B signal and the microcontroller.
  - The value of the limiting resistance should be set so that when the +B signal is applied the input current to the microcontroller pin does not exceed rated values, either instantaneously or for prolonged periods.
  - Note that when the microcontroller drive current is low, such as in the power saving modes, the +B input potential may pass through the protective diode and increase the potential at the  $V_{CC}$  pin, and this may affect other devices.
  - Note that if a +B signal is input when the microcontroller power supply is off (not fixed at 0 V) , the power supply is provided from the pins, so that incomplete operation may result.
  - Note that if the +B input is applied during power-on, the power supply is provided from the pins and the resulting power supply voltage may not be sufficient to operate the power-on reset.
  - Care must be taken not to leave the +B input pin open.
  - Sample recommended circuits:

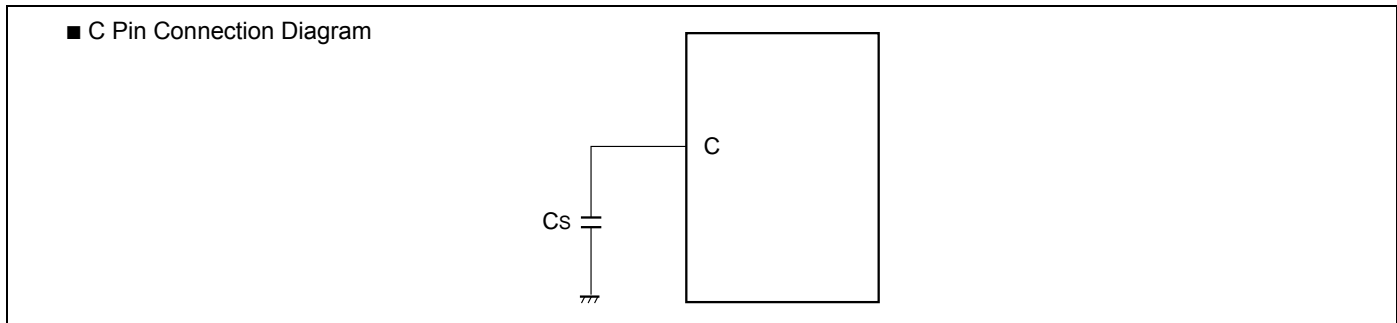

\*6 : If used exceeding  $T_A = +105\text{ }^\circ\text{C}$ , be sure to contact sales for reliability limitations.

**WARNING:** Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

**15.2 Recommended Operating Conditions**
 $(V_{SS} = AV_{SS} = 0\text{ V})$ 

Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max		
Power supply voltage	$V_{CC}, AV_{CC}$	4.0	5.0	5.5	V	Under normal operation
		3.5	5.0	5.5	V	Under normal operation, when not using the A/D converter and not Flash programming.
		4.5	5.0	5.5	V	When External bus is used.
		3.0	—	5.5	V	Maintains RAM data in stop mode
Smooth capacitor	$C_S$	0.1	—	1.0	$\mu\text{F}$	Use a ceramic capacitor or capacitor of better AC characteristics. Bypass capacitor at the $V_{CC}$ pin should be greater than this capacitor.
Operating temperature	$T_A$	-40	—	+105	$^{\circ}\text{C}$	MB90F352(S) $f_{CP} \leq 24\text{MHz}$
		-40	—	+125	$^{\circ}\text{C}$	*, MB90F352(S) $f_{CP} \leq 16\text{MHz}$ , Devices with A-suffix

\* : If used exceeding  $T_A = +105\text{ }^{\circ}\text{C}$ , be sure to contact sales for reliability limitations.

**WARNING:** The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges. Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure. No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

\*1 : R,C : Pull-up resistor and load capacitor of the SCL and SDA lines.

\*2 : The maximum  $t_{HDDAT}$  has only to be met if the device does not stretch the “L” width ( $t_{LOW}$ ) of the SCL signal.

\*3 : A Fast-mode I<sup>2</sup>C -bus device can be used in a Standard-mode I<sup>2</sup>C-bus system, but the requirement  $t_{SUDAT} \geq 250\text{ ns}$  must then be met.

\*4 : For use at over 100 kHz, set the machine clock to at least 6 MHz.

\*5 : Refer to “Note of SDA, SCL set-up time”.

**Note :** The rating of the input data set-up time in the device connected to the bus cannot be satisfied depending on the load capacitance or pull-up resistor.  
 Be sure to adjust the pull-up resistor of SDA and SCL if the rating of the input data set-up time cannot be satisfied.

**Notes on A/D Converter Section**
**■ About the external impedance of the analog input and its sampling time**

A/D converter with sample and hold circuit. If the external impedance is too high to keep sufficient sampling time, the analog voltage charged to the internal sample and hold capacitor is insufficient, adversely affecting A/D conversion precision. Therefore to satisfy the A/D conversion precision standard, consider the relationship between the external impedance and minimum sampling time and either adjust the register value and operating frequency or decrease the external impedance so that the sampling time is longer than the minimum value. Also if the sampling time cannot be sufficient, connect a capacitor of about 0.1  $\mu\text{F}$  to the analog input pin.

**About the error**

Values of relative errors grow larger, as  $|AV_{RH} - AV_{SS}|$  becomes smaller.

**15.6 Definition of A/D Converter Terms**

- Resolution : Analog variation that is recognized by an A/D converter.
- Non linearity error : Deviation between a line across zero-transition line ( "00 0000 0000" ← → "00 0000 0001" ) and full-scale transition line ( "11 1111 1110" ← → "11 1111 1111" ) and actual conversion characteristics.
- Differential linearity error : Deviation of input voltage, which is required for changing output code by 1 LSB, from an ideal value.
- Total error : Difference between an actual value and a theoretical value. A total error includes zero transition error, full-scale transition error, and linear error.

$$\text{Total error of digital output "N"} = \frac{V_{NT} - \{1 \text{ LSB} \times (N - 1) + 0.5 \text{ LSB}\}}{1 \text{ LSB}} \text{ [LSB]}$$

$$1 \text{ LSB} = (\text{Ideal value}) \frac{AVRH - AV_{SS}}{1024} \text{ [V]}$$

**N** : A/D converter digital output value

**V<sub>OT</sub>** (Ideal value) = AV<sub>SS</sub> + 0.5 LSB [V]

**V<sub>FST</sub>** (Ideal value) = AVRH - 1.5 LSB [V]

**V<sub>NT</sub>** : A voltage at which digital output transits from (N - 1) to N.

(Continued)

(Continued)

$$\text{Non linearity error of digital output } N = \frac{V_{NT} - \{1 \text{ LSB} \times (N - 1) + V_{OT}\}}{1 \text{ LSB}} \text{ [LSB]}$$

$$\text{Differential linearity error of digital output } N = \frac{V_{(N+1)T} - V_{NT}}{1 \text{ LSB}} - 1 \text{ LSB [LSB]}$$

$$1 \text{ LSB} = \frac{V_{FST} - V_{OT}}{1022} \text{ [V]}$$

**N** : A/D converter digital output value

**V<sub>OT</sub>** : Voltage at which digital output transits from “000<sub>H</sub>” to “001<sub>H</sub>.”

**V<sub>FST</sub>** : Voltage at which digital output transits from “3FE<sub>H</sub>” to “3FF<sub>H</sub>.”
