Mini-Watt Audio Output

This device is a rugged and versatile power amplifier in a remarkable plastic power package.

- Supply Voltages from 6.0 Vdc to 35 Vdc
- 2.0 W Output @ 70°C Ambient on PC Board with Good Copper Ground Plane
- Self Protecting Thermal Shutdown
- Easy to Apply, Few Components
- Gain Externally Determined
- Output is Independent of Supply Voltage Over a Wide Range

GENERAL DESCRIPTION

The MC13060 is a quasi-complementary audio power amplifier, mounted in the SOP 8 (power SOIC package). It is well suited to a variety of 1.0 W and 2.0 W applications in radio, TV, intercom, and other speaker driving tasks. It requires the usual external components for high frequency stability and for gain adjustment.

The output signal voltage and the power supply drain current are very linearly related, as shown in Figure 5. Both are quite constant over wide variation of the power supply voltage (above minimum V_{CC} for clipping, of course). The

amplifier can best be described as a voltage source with about 1.0 A_{pp} capability. On a good heatsink, it can deliver over 2.0 W at 70 $^{\circ}C$ ambient.

The MC13060 will automatically go into shutdown at a die temperature of about 150 $^{\circ}C$, effectively protecting itself, even on fairly stiff power supplies. This eliminates the need for decoupling the power supply, which degrades performance and requires extra components.

Input Pins 5 and 8 are internally biased at 0.7 Vdc and should not be driven below ground.
