

4MB R4000 Secondary Cache Fast Static RAM Module Set

MCM44256B Series

Four MCM44256B modules comprise a full 4 MB of secondary cache for the R4000 processor. Each module contains nine MCM6729DWJ fast static RAMs for a cache data size of 256K x 36. The tag portion, dependent on word line size, contains either two MCM6729DWJ or one MCM6726DWJ fast static RAMs. All input signals, except A0 and WE are buffered using 74FBT2827 drivers with series 25 Ω resistors.

The MCM6729DWJ and MCM6726DWJ are fabricated using high-performance silicon-gate BiCMOS technology. Static design eliminates the need for internal clocks or timing strobes.

All 4MB R4000 supported secondary cache options are available.

- Single 5 V ± 10% Power Supply
- All Inputs and Outputs are TTL Compatible
- Fast Module Access Time: 12/15/17 ns
- Zero Wait-State Operation
- Unified or Split Secondary Cache is Supported
- Word Line Sizes of 4, 8, 16, and 32 are Available (See Ordering Information for Details)
- Decoupling Capacitors are Used for Each Fast Static RAM and Buffer, Along with Bulk Capacitance for Maximum Noise Immunity
- High Quality Multi-Layer FR4 PWB with Separate Power and Ground Planes

ABSOLUTE MAXIMUM RATINGS (Voltages Referenced to $V_{SS} = 0$ V)

Rating	Symbol	Value	Unit
Power Supply Voltage	V_{CC}	- 0.5 to 7.0	V
Voltage Relative to V_{SS}	V_{in}, V_{out}	- 0.5 to $V_{CC} + 0.5$	V
Output Current (per I/O)	I_{out}	± 30	mA
Power Dissipation	P_D	10	W
Temperature Under Bias	T_{bias}	- 10 to + 85	$^{\circ}C$
Storage Temperature	T_{stg}	- 25 to +125	$^{\circ}C$

NOTE: Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. Functional operation should be restricted to RECOMMENDED OPERATING CONDITIONS. Exposure to higher than recommended voltages for extended periods of time could affect device reliability.

This devices on this module contain circuitry to protect the inputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to these high-impedance circuits.

These BiCMOS memory circuits have been designed to meet the dc and ac specifications shown in the tables, after thermal equilibrium has been established. The module is in a test socket or mounted on a printed circuit board and transverse air flow of at least 500 linear feet per minute is maintained.

4. This parameter is sampled and not 100% tested.

TIMING LIMITS

The table of timing values shows either a minimum or a maximum limit for each parameter. Input requirements are specified from the external system point of view. Thus, address setup time is shown as a minimum since the system must supply at least that much time. On the other hand, responses from the memory are specified from the device point of view. Thus, the access time is shown as a maximum since the device never provides data later than that time.
