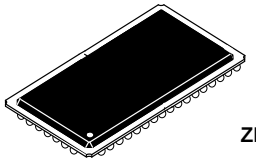
256K x 18 Bit Flow–Through BurstRAM™ Synchronous Fast Static RAM



ZP PACKAGE
PBGA
CASE 999–01

The MCM69F817 is a 4M bit synchronous fast static RAM designed to provide a burstable, high performance, secondary cache for the PowerPC™ and other high performance microprocessors. It is organized as 256K words of 18 bits each. This device integrates input registers, a 2–bit address counter, and high speed SRAM onto a single monolithic circuit for reduced parts count in cache data RAM applications. Synchronous design allows precise cycle control with the use of an external clock (K).

Addresses (SA), data inputs (DQx), and all control signals except output enable (G) and linear burst order (LBO) are clock (K) controlled through positive–edge–triggered noninverting registers.

Bursts can be initiated with either ADSP or ADSC input pins. Subsequent burst addresses can be generated internally by the MCM69F817 (burst sequence operates in linear or interleaved mode dependent upon the state of LBO) and controlled by the burst address advance (ADV) input pin.

Write cycles are internally self–timed and are initiated by the rising edge of the clock (K) input. This feature eliminates complex off–chip write pulse generation and provides increased timing flexibility for incoming signals.

Synchronous byte write (SBx), synchronous global write (SGW), and synchronous write enable (SW) are provided to allow writes to either individual bytes or to all bytes. The two bytes are designated as “a” and “b”. SBa controls DQa and SBb controls DQb. Individual bytes are written if the selected byte writes SBx are asserted with SW. All bytes are written if either SGW is asserted or if all SBx and SW are asserted.

For read cycles, a flow–through SRAM allows output data to simply flow freely from the memory array.

The MCM69F817 operates from a 3.3 V core power supply and all outputs operate on a 3.3 V or 2.5 V power supply. All inputs and outputs are JEDEC standard JESD8–5 compatible.

- MCM69F817 Speed Options

Speed	t_{KHKH}	Flow–Through t_{KHQV}	Setup	Hold	I_{DD}
150 MHz	6.7 ns	6 ns	0.5 ns	1 ns	375 mA
133 MHz	7.5 ns	6.5 ns	0.5 ns	1 ns	350 mA
117 MHz	8.5 ns	7 ns	0.5 ns	1 ns	325 mA

- 3.3 V + 10%, – 5% Core Power Supply, Operates with a 3.3 V or 2.5 V I/O Supply
- ADSP, ADSC, and ADV Burst Control Pins
- Selectable Burst Sequencing Order (Linear/Interleaved)
- Single–Cycle Deselect Timing
- Internally Self–Timed Write Cycle
- Byte Write and Global Write Control
- PB1 Version 2.0 Compatible
- JEDEC Standard 119–Pin PBGA Package

PBGA PIN DESCRIPTIONS

Pin Locations	Symbol	Type	Description
4B	$\overline{\text{ADSC}}$	Input	Synchronous Address Status Controller: Active low, interrupts any ongoing burst and latches a new external address. Used to initiate a READ, WRITE, or chip deselect.
4A	$\overline{\text{ADSP}}$	Input	Synchronous Address Status Processor: Active low, interrupts any ongoing burst and latches a new external address used to initiate a new READ or chip deselect (exception — chip deselect does not occur when ADSP is asserted and SE1 is high).
4G	$\overline{\text{ADV}}$	Input	Synchronous Address Advance: Increments address count in accordance with counter type selected (linear/interleaved).
(a) 6D, 7E, 6F, 7G, 6H, 7K, 6L, 6N, 7P (b) 1D, 2E, 2G, 1H, 2K, 1L, 2M, 1N, 2P	DQx	I/O	Synchronous Data I/O: “x” refers to the byte being read or written (byte a, b).
4F	$\overline{\text{G}}$	Input	Asynchronous Output Enable Input: Low — enables output buffers (DQx pins). High — DQx pins are high impedance.
4K	K	Input	Clock: This signal registers the address, data in, and all control signals except G and LBO.
3R	$\overline{\text{LBO}}$	Input	Linear Burst Order Input: This pin must remain in steady state (this signal not registered or latched). It must be tied high or low. Low — linear burst counter (68K/PowerPC). High — interleaved burst counter (486/i960/Pentium).
2A, 3A, 5A, 6A, 3B, 5B, 2C, 3C, 5C, 6C, 2R, 6R, 2T, 3T, 5T, 6T	SA	Input	Synchronous Address Inputs: These inputs are registered and must meet setup and hold times.
4N, 4P	SA1, SA0	Input	Synchronous Address Inputs: These pins must be wired to the two LSBs of the address bus for proper burst operation. These inputs are registered and must meet setup and hold times.
5L, 3G (a) (b)	$\overline{\text{SBx}}$	Input	Synchronous Byte Write Inputs: “x” refers to the byte being written (byte a, b). SGW overrides SBx.
4E	SE1	Input	Synchronous Chip Enable: Active low to enable chip. Negated high — blocks ADSP or deselects chip when ADSC is asserted.
2B	SE2	Input	Synchronous Chip Enable: Active high for depth expansion.
6B	$\overline{\text{SE3}}$	Input	Synchronous Chip Enable: Active low for depth expansion.
4H	$\overline{\text{SGW}}$	Input	Synchronous Global Write: This signal writes all bytes regardless of the status of the SBx and SW signals. If only byte write signals SBx are being used, tie this pin high.
4M	$\overline{\text{SW}}$	Input	Synchronous Write: This signal writes only those bytes that have been selected using the byte write SBx pins. If only byte write signals SBx are being used, tie this pin low.
4C, 2J, 4J, 6J, 4R	V_{DD}	Supply	Core Power Supply.
1A, 7A, 1F, 7F, 1J, 7J, 1M, 7M, 1U, 7U	V_{DDQ}	Supply	I/O Power Supply.
3D, 5D, 3E, 5E, 3F, 5F, 5G, 3H, 5H, 3K, 5K, 3L, 3M, 5M, 3N, 5N, 3P, 5P	V_{SS}	Supply	Ground.
1B, 7B, 1C, 7C, 2D, 4D, 7D, 1E, 6E, 2F, 1G, 6G, 2H, 7H, 3J, 5J, 1K, 6K, 2L, 4L, 7L, 6M, 2N, 7N, 1P, 6P, 1R, 5R, 7R, 1T, 4T, 7T, 2U, 3U, 4U, 5U, 6U	NC	—	No Connection: There is no connection to the chip.

TRUTH TABLE (See Notes 1 Through 5)

Next Cycle	Address Used	$\overline{SE1}$	SE2	$\overline{SE3}$	$\overline{ADSP}$	$\overline{ADSC}$	$\overline{ADV}$	$\overline{G}$ [3]	DQx	Write [2, 4]

Suspend Write	Current	X	X	X	1	1	1	X	High–Z	WRITE
Suspend Write	Current	1	X	X	X	1	1	X	High–Z	WRITE

NOTES:
1. X = don't care. 1 = logic high. 0 = logic low.
2. Write is defined as either (a) any SBx and SW low or (b) SGW is low.
3. G is an asynchronous signal and is not sampled by the clock K. G drives the bus immediately (t_{GLQX}) following $\overline{G}$ going low.
4. On write cycles that follow read cycles, G must be negated prior to the start of the write cycle to ensure proper write data setup times. G must also remain negated at the completion of the write cycle to ensure proper write data hold times.
5. This read assumes the RAM was previously deselected.

ABSOLUTE MAXIMUM RATINGS (See Note 1)

Rating	Symbol	Value	Unit
Power Supply Voltage	V_{DD}	V_{SS} – 0.5 to + 4.6	V
I/O Supply Voltage (See Note 2)	V_{DDQ}	V_{SS} – 0.5 to V_{DD}	V
Input Voltage Relative to V_{SS} for Any Pin Except V_{DD} (See Note 2)	V_{in}, V_{out}	V_{SS} – 0.5 to V_{DD} + 0.5	V
Input Voltage (Three–State I/O) (See Note 2)	V_{IT}	V_{SS} – 0.5 to V_{DDQ} + 0.5	V
Output Current (per I/O)	I_{out}	± 20	mA
Package Power Dissipation (See Note 3)	P_D	1.6	W
Temperature Under Bias	T_{bias}	– 10 to 85	°C
Storage Temperature	T_{stg}	– 55 to 125	°C

NOTES:
1. Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. Functional operation should be restricted to RECOMMENDED OPERATING CONDITIONS. Exposure to higher than recommended voltages for extended periods of time could affect device reliability.
2. This is a steady–state DC parameter that is in effect after the power supply has achieved its nominal operating level. Power sequencing can not be controlled and is not allowed.
3. Power dissipation capability is dependent upon package characteristics and use environment. See Package Thermal Characteristics.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high–impedance circuit.

PACKAGE THERMAL CHARACTERISTICS — PBGA

Rating		Symbol	Max	Unit	Notes
Junction to Ambient (@ 200 lfm)	Single Layer Board Four Layer Board	$R_{\theta JA}$	41 19	°C/W	1, 2
Junction to Board (Bottom)		$R_{\theta JB}$	11	°C/W	3
Junction to Case (Top)		$R_{\theta JC}$	19	°C/W	4

NOTES:
1. Junction temperature is a function of on–chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, board population, and board thermal resistance.
2. Per SEMI G38–87.
3. Indicates the average thermal resistance between the die and the printed circuit board.
4. Indicates the average thermal resistance between the die and the case top surface via the cold plate method (MIL SPEC–883 Method 1012.1).

DC OPERATING CONDITIONS AND CHARACTERISTICS

Clock Running (Device Deselected, Freq = Max, V_{DD} = Max, All Inputs Toggling at CMOS Levels V_{in} ≤ V_{SS} + 0.2 V or ≥ V_{DD} – 0.2 V) — MCM69F817–6	I_{SB4}	—	—	TBD	mA	5
Static Clock Running (Device Deselected, Freq = Max, V_{DD} = Max, All Inputs Static at V_{in} ≤ V_{IL} or ≥ V_{IH}) — MCM69F817–6	I_{SB5}	—	—	TBD	mA	5
Output Low Voltage (I_{OL} = 2 mA) V_{DDQ} = 2.5 V	V_{OL1}	—	—	0.7	V	
Output High Voltage (I_{OH} = – 2 mA) V_{DDQ} = 2.5 V	V_{OH1}	1.7	—	—	V	
Output Low Voltage (I_{OL} = 8 mA) V_{DDQ} = 3.3 V	V_{OL2}	—	—	0.4	V	
Output High Voltage (I_{OH} = – 4 mA) V_{DDQ} = 3.3 V	V_{OH2}	2.4	—	—	V	

NOTES:
1. LBO pin has an internal pullup and will exhibit leakage currents of ± 5 µA.
2. Reference AC Operating Conditions and Characteristics for input and timing (V_{IH}/V_{IL}, t_r/t_f, pulse level 0 to 3.0 V).
3. All addresses transition simultaneously low (LSB) and then high (MSB).
4. Data states are all zero.
5. Device in Deselected mode as defined by the Truth Table.

CAPACITANCE (f = 1.0 MHz, dV = 3.0 V, 70°C ≥ T_A ≥ 0°C, Periodically Sampled Rather Than 100% Tested)

Data In	t_{KHDX}								
Write	t_{KHWX}								
Chip Enable	t_{KHEX}								

NOTES:
1. Write is defined as either any $\overline{SBx}$ and $\overline{SW}$ low or $\overline{SGW}$ is low. Chip Enable is defined as $\overline{SE1}$ low, SE2 high, and $\overline{SE3}$ low whenever $\overline{ADSP}$ or ADSC is asserted.
2. All read and write cycle timings are referenced from K or $\overline{G}$.
3. Tested per AC Test Load, Figure 2.
4. Measured at ± 200 mV from steady state.
5. This parameter is sampled and not 100% tested.

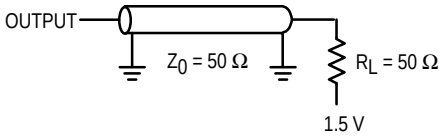

Figure 2. AC Test Load

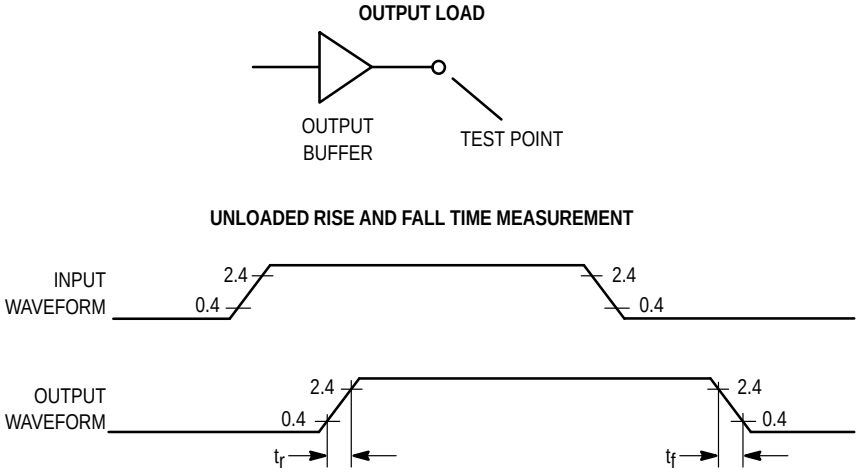

NOTES:
1. Input waveform has a slew rate of 1 V/ns.
2. Rise time is measured from 0.4 to 2.4 V unloaded.
3. Fall time is measured from 2.4 to 0.4 V unloaded.

Figure 3. Unloaded Rise and Fall Time Characterization

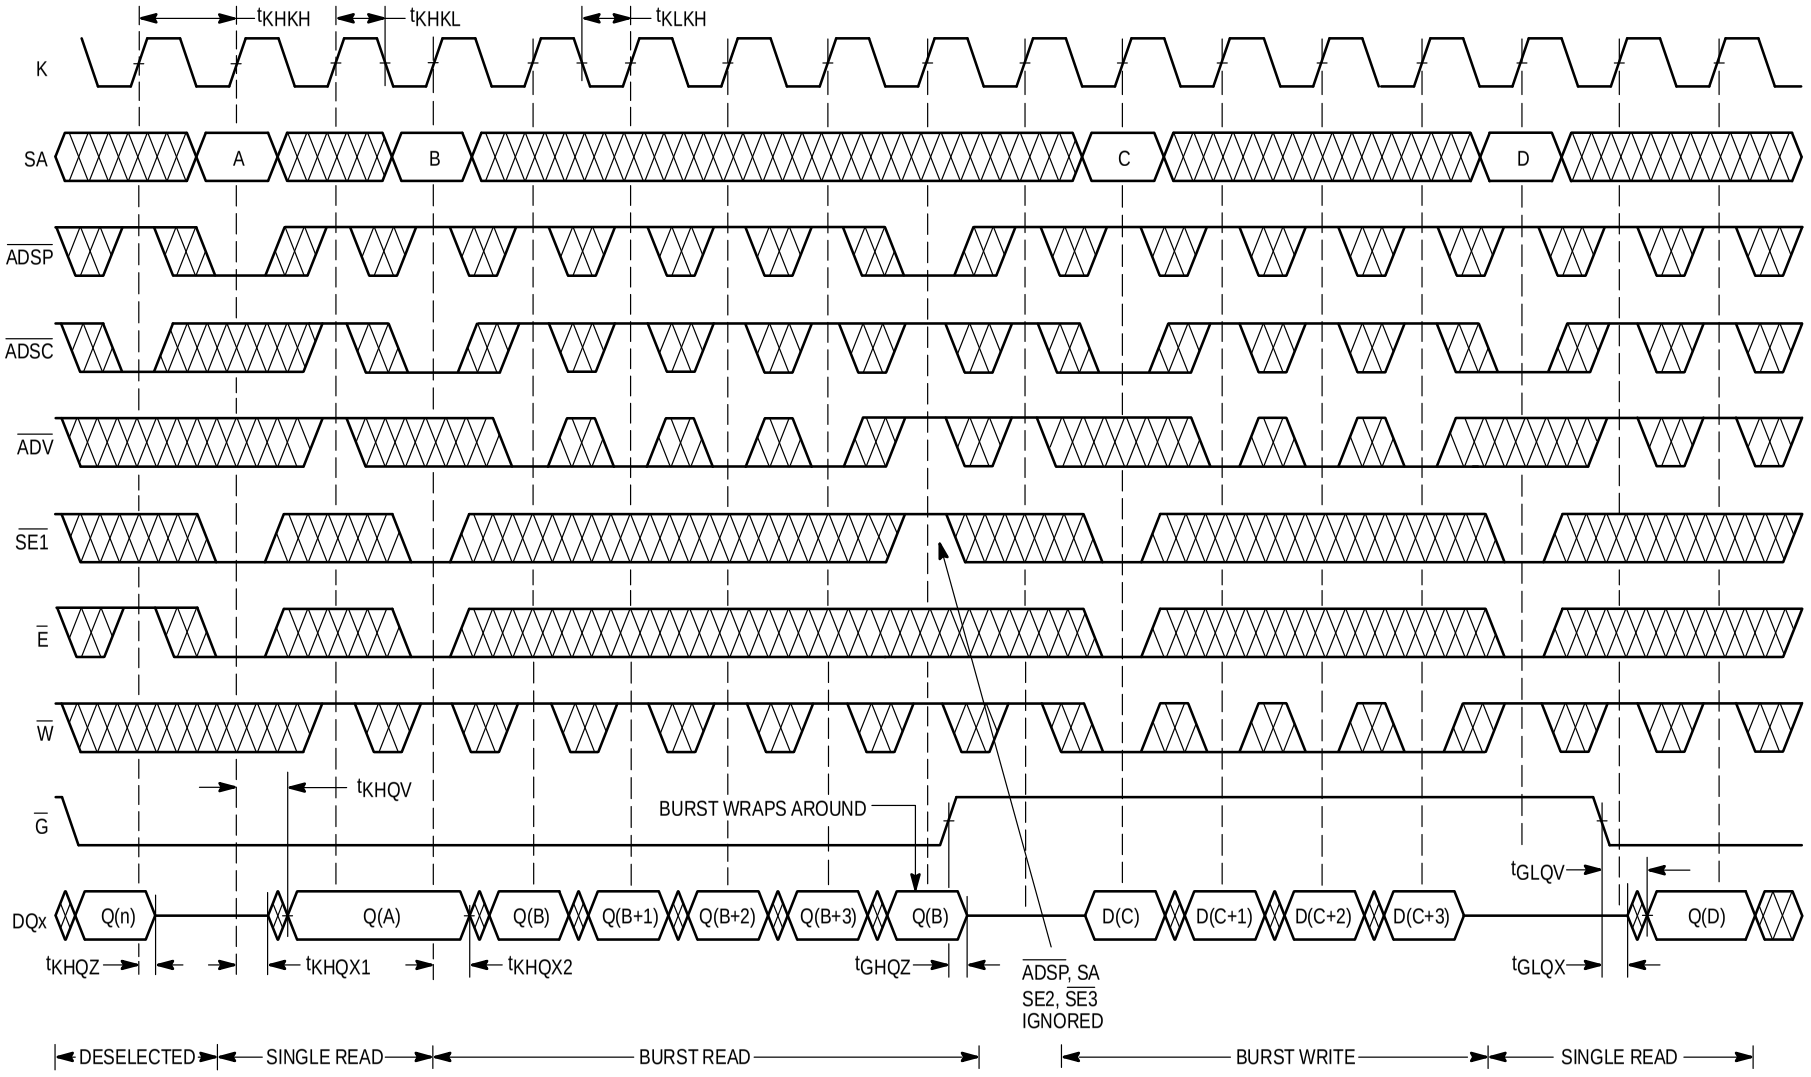
READ/WRITE CYCLES



NOTE: $\overline{E}$ low = SE2 high and $\overline{SE3}$ low.
$\overline{W}$ low = $\overline{SGW}$ low and/or $\overline{SW}$ and $\overline{SBx}$ low.

APPLICATION INFORMATION

STOP CLOCK OPERATION

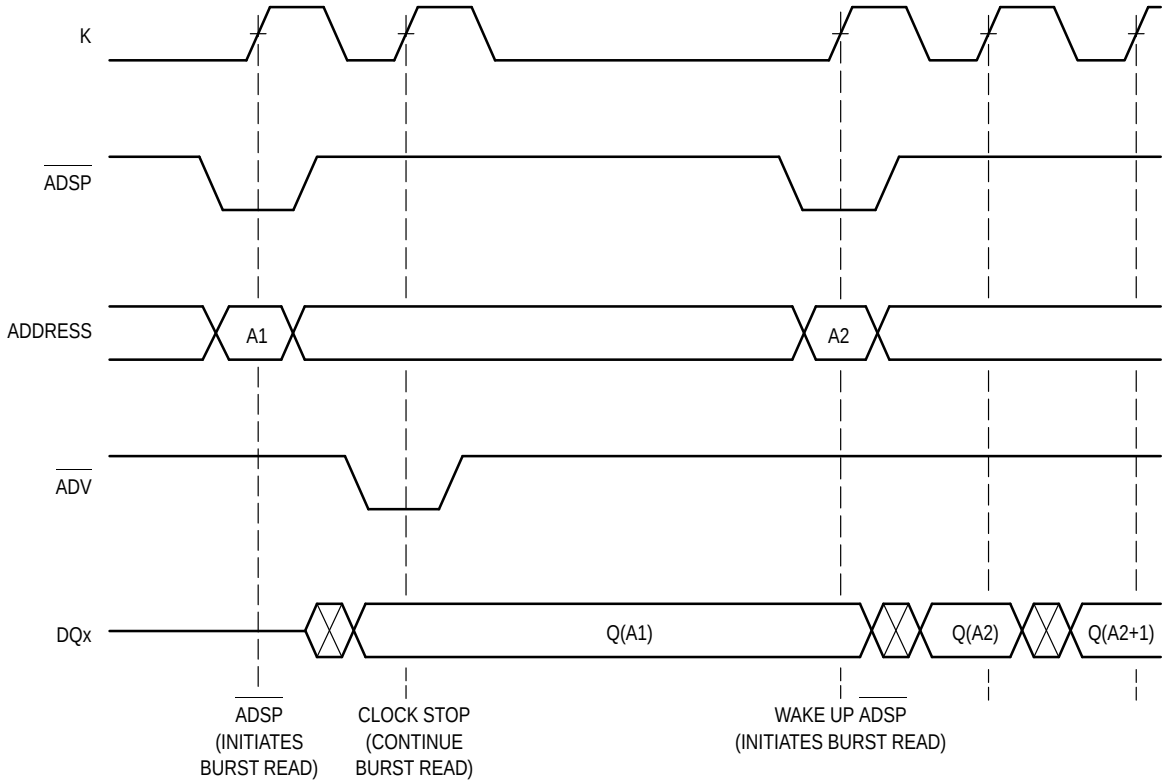
In the stop clock mode of operation, the SRAM will hold all state and data values even though the clock is not running (full static operation). The SRAM design allows the clock to start with ADSP and ADSC, and stops the clock after the last write data is latched, or the last read data is driven out.

When starting and stopping the clock, the AC clock timing and parametrics must be strictly maintained. For example, clock pulse width and edge rates must be guaranteed when starting and stopping the clocks.

To achieve the lowest power operation for all three stop clock modes, stop read, stop write, and stop deselect:

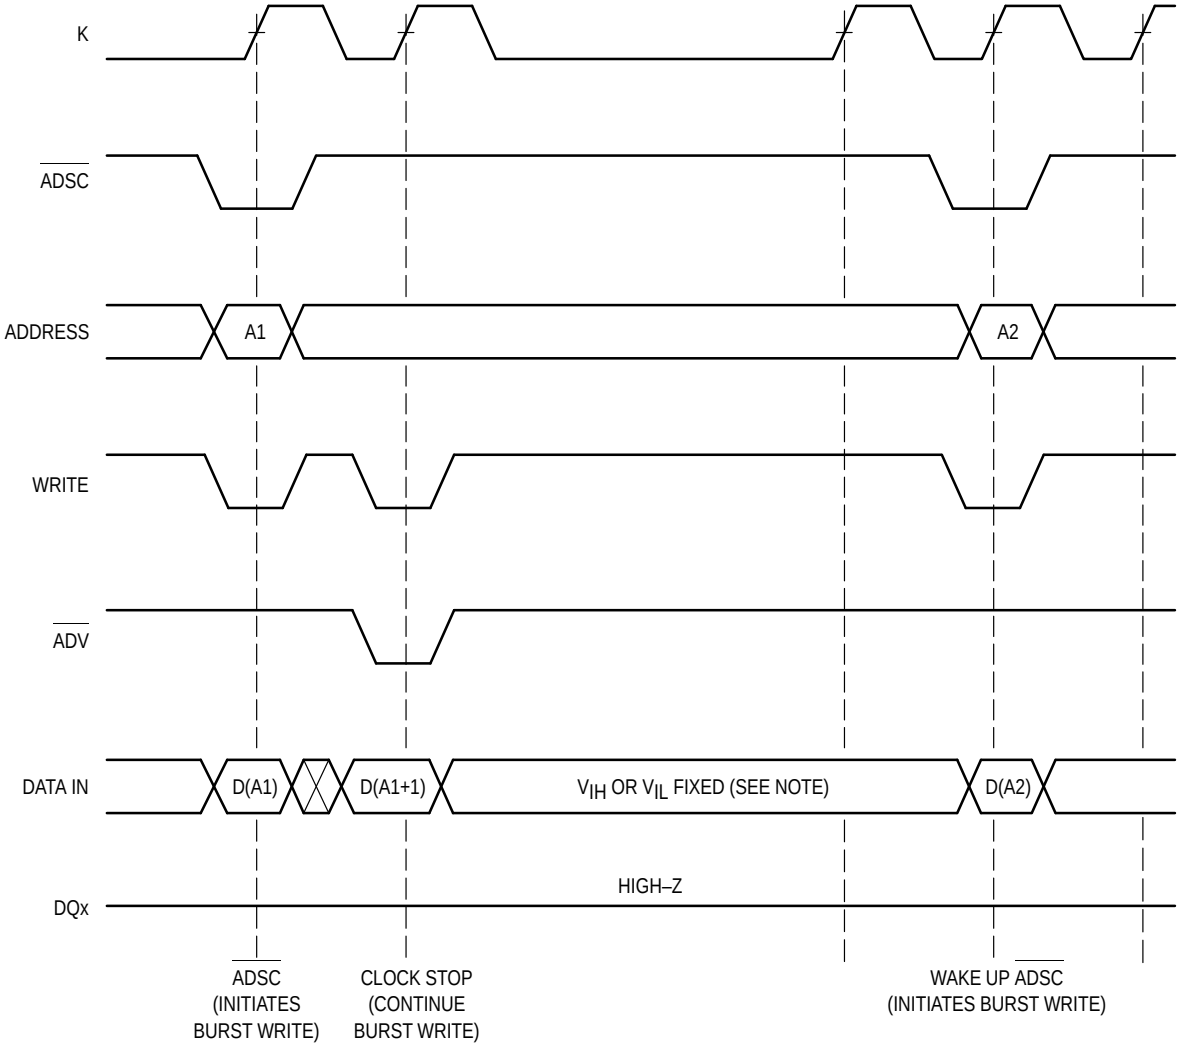
- Force the clock to a low state.
- Force the control signals to an inactive state (this guarantees any potential source of noise on the clock input will not start an unplanned on activity).
- Force the address inputs to a low state (V_{IL}), preferably < 0.2 V.

STOP CLOCK WITH READ TIMING



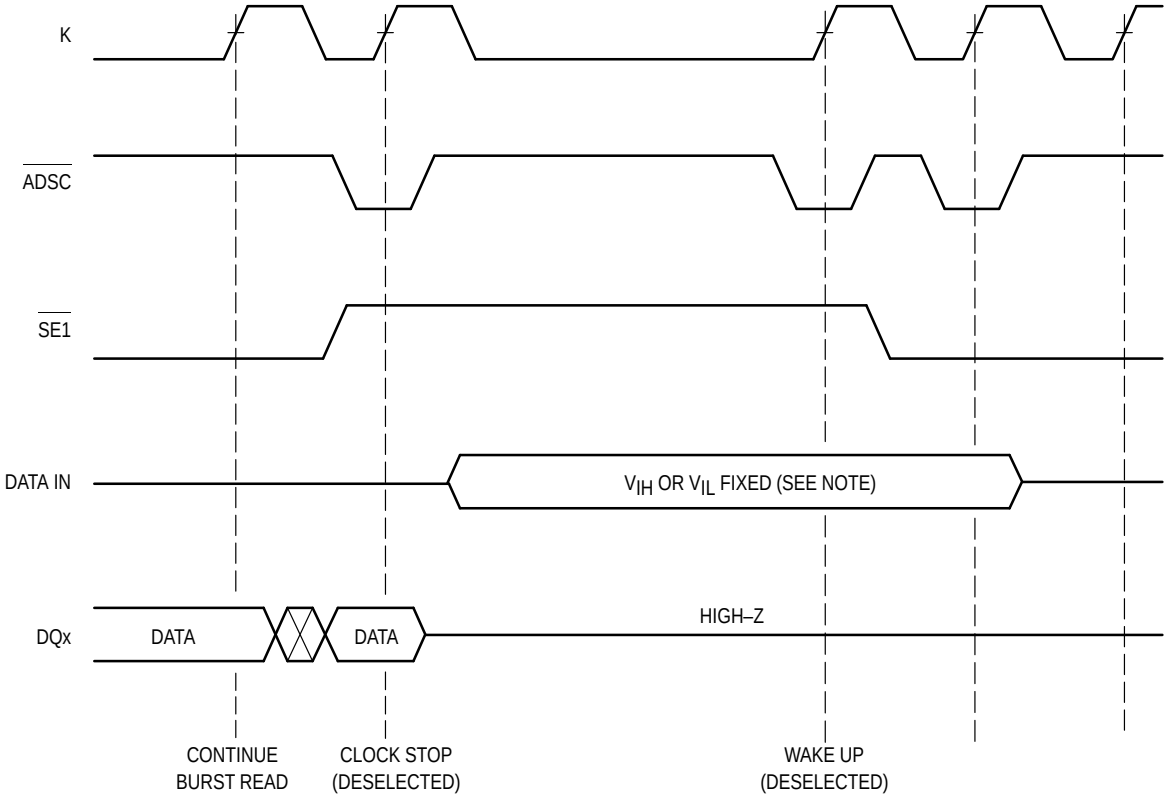
NOTE: For lowest possible power consumption during stop clock, the addresses should be driven to a low state (V_{IL}). Best results are obtained if V_{IL} < 0.2 V.

STOP CLOCK WITH WRITE TIMING



NOTE: While the clock is stopped, DATA IN must be fixed in a high (V_{IH}) or low (V_{IL}) state to reduce the DC current of the input buffers. For lowest power operation, all data and address lines should be held in a low (V_{IL}) state and control lines held in an inactive state.

STOP CLOCK WITH DESELECT OPERATION TIMING



NOTE: While the clock is stopped, DATA IN must be fixed in a high (V_{IH}) or low (V_{IL}) state to reduce the DC current of the input buffers. For lowest power operation, all data and address lines should be held in a low (V_{IL}) state and control lines held in an inactive state.

NON–BURST SYNCHRONOUS OPERATION

Although this BurstRAM has been designed for PowerPC–based and other high end MPU–based systems, these SRAMs can be used in other high speed L2 cache or memory applications that do not require the burst address feature. Most L2 caches designed with a synchronous interface can make use of the MCM69F817. The burst counter feature of the BurstRAM can be disabled, and the SRAM can be configured to act upon a continuous stream of addresses. See Figure 5.

CONTROL PIN TIE VALUES ($H \geq V_{IH}$, $L \leq V_{IL}$)

Non–Burst	ADSP	ADSC	ADV	SE1	LBO
Sync Non–Burst, Flow–Through SRAM	H	L	H	L	X

NOTE: Although X is specified in the table as a don't care, the pin must be tied either high or low.

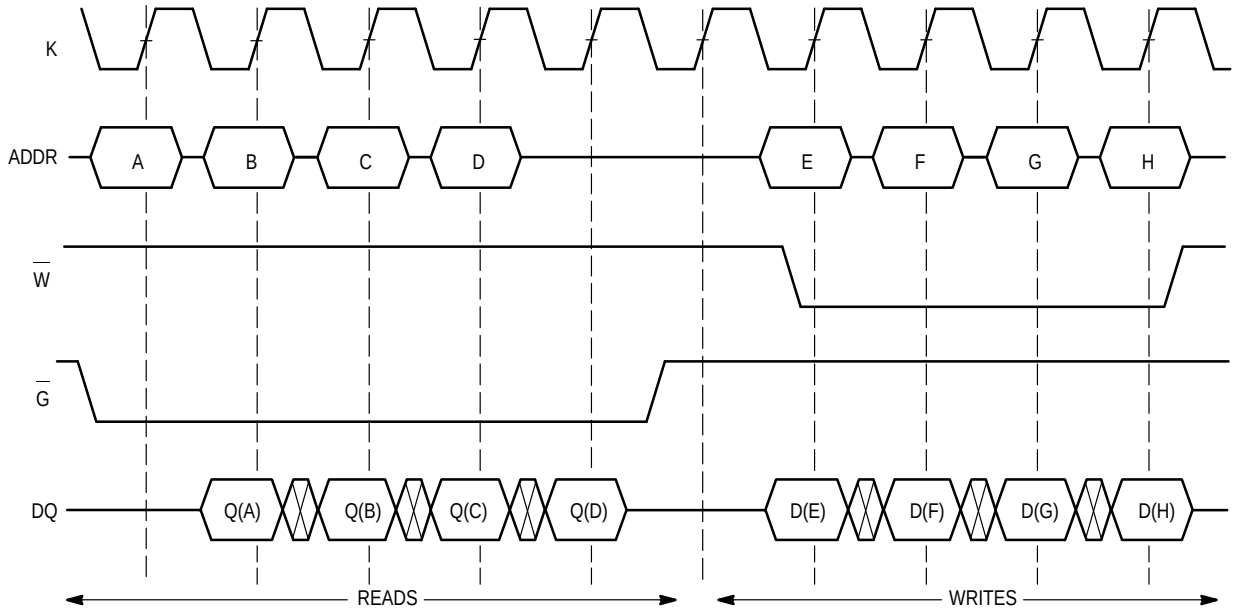


Figure 5. Configured as Non–Burst Synchronous SRAM

ORDERING INFORMATION
(Order by Full Part Number)

MCM 69F817 XX X X

- MCM: Motorola Memory Prefix
- 69F817: Part Number
- XX: Package (ZP = PBGA)
- X: Speed (6 = 6.0 ns, 6.5 = 6.5 ns, 7 = 7.0 ns)
- X: Blank = Trays, R = Tape and Reel

Full Part Numbers — MCM69F817ZP6, MCM69F817ZP6R, MCM69F817ZP6.5, MCM69F817ZP6.5R, MCM69F817ZP7, MCM69F817ZP7R
