

256KB and 512KB BurstRAM™ Secondary Cache Module for Pentium™

The MCM72BA32SG and MCM72BA64SG are designed to provide a burstable, high performance, 256K/512K L2 cache for the Pentium microprocessor. The modules are configured as 32K x 72 and 64K x 72 bits in a 136 pin dual read-out single inline memory module (DIMM). The module uses four of Motorola's MCM67B518 or MCM67B618 BiCMOS BurstRAMs.

Bursts can be initiated with either address status processor (\overline{ADSP}) or address status controller (\overline{ADSC}). Subsequent burst addresses are generated internal to the BurstRAM by the burst advance (\overline{ADV}) input pin.

Write cycles are internally self timed and are initiated by the rising edge of the clock (K) input. Eight write enables are provided for byte write control.

The cache family is designed to interface with popular Pentium cache controllers with on board TAG.

PD0 – PD2 are reserved for density and speed identification.

- Pentium-style Burst Counter on Board
- Dual Readout SIMM for Circuit Density
- Single 5 V \pm 5% Power Supply
- All Inputs and Outputs are TTL Compatible
- Three State Outputs
- Byte Parity
- Byte Write Capability
- Fast Module Clock Rates: 66 MHz, 60 MHz, 50MHz
- Decoupling Capacitors for each Fast Static RAM
- High Quality Multi-Layer FR4 PWB With Separate Power and Ground Planes
- I/Os are 3.3 V Compatible

BurstRAM is a trademark of Motorola.
Pentium is a trademark of Intel Corp.

32K x 72 BurstRAM MEMORY MODULE BLOCK DIAGRAM

MCM67B618 BLOCK DIAGRAM (See Note)

NOTE: All registers are positive-edge triggered. The \overline{ADSC} or \overline{ADSP} signals control the duration of the burst and the start of the next burst. When \overline{ADSP} is sampled low, any ongoing burst is interrupted and a read (independent of \overline{W} and \overline{ADSC}) is performed using the new external address. Alternatively, an \overline{ADSP} -initiated two cycle WRITE can be performed by asserting \overline{ADSP} and a valid address on the first cycle, then negating both \overline{ADSP} and \overline{ADSC} and asserting \overline{LW} and/or \overline{UW} with valid data on the second cycle (see Single Write Cycle in WRITE CYCLES timing diagram). When \overline{ADSC} is sampled low (and \overline{ADSP} is sampled high), any ongoing burst is interrupted and a read or write (dependent on \overline{W}) is performed using the new external address. Chip enable (\overline{E}) is sampled only when a new base address is loaded. After the first cycle of the burst, \overline{ADV} controls subsequent burst cycles. When \overline{ADV} is sampled low, the internal address is advanced prior to the operation. When \overline{ADV} is sampled high, the internal address is not advanced, thus inserting a wait state into the burst sequence accesses. Upon completion of a burst, the address will wrap around to its initial state. See **BURST SEQUENCE TABLE**. Write refers to either or both byte write enables (\overline{LW} , \overline{UW}).

BURST SEQUENCE TABLE (See Note)

External Address	A15 – A2	A1	A0
1st Burst Address	A15 – A2	A1	$\overline{A0}$
2nd Burst Address	A15 – A2	$\overline{A1}$	A0
3rd Burst Address	A15 – A2	$\overline{A1}$	$\overline{A0}$

NOTE: The burst wraps around to its initial state upon completion.

SYNCHRONOUS TRUTH TABLE (See Notes 1, 2, and 3)

X	H	H	H	L	L-H	Current Address	Write Cycle, Suspend Burst
X	H	H	H	H	L-H	Current Address	Read Cycle, Suspend Burst

NOTES:

1. X means Don't Care.
2. All inputs except \bar{G} must meet setup and hold times for the low-to-high transition of clock (K).
3. Wait states are inserted by suspending burst.

ASYNCHRONOUS TRUTH TABLE (See Notes 1 and 2)

Operation	\bar{G}	I/O Status
Read	L	Data Out
Read	H	High-Z
Write	X	High-Z — Data In
Deselected	X	High-Z

NOTES:

1. X means Don't Care.
2. For a write operation following a read operation, \bar{G} must be high before the input data required setup time and held high through the input data hold time.

ABSOLUTE MAXIMUM RATINGS (Voltages Referenced to $V_{SS} = 0$ V)

Rating	Symbol	Value	Unit
Power Supply Voltage	V_{CC}	- 0.5 to + 7.0	V
Voltage Relative to V_{SS} for Any Pin Except V_{CC}	V_{in}, V_{out}	- 0.5 to $V_{CC} + 0.5$	V
Output Current (per I/O)	I_{out}	± 30	mA
Power Dissipation	P_D	6.0	W
Temperature Under Bias	T_{bias}	- 10 to + 85	°C
Operating Temperature	T_A	0 to +70	°C
Storage Temperature	T_{stg}	- 55 to + 125	°C

NOTE: Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. Functional operation should be restricted to RECOMMENDED OPERATING CONDITIONS. Exposure to higher than recommended voltages for extended periods of time could affect device reliability.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high-impedance circuit.

This device contains circuitry that will ensure the output devices are in High-Z at power up.

NOTES:

1. A read cycle is defined by \overline{UW} and \overline{LW} high or \overline{ADSP} low for the setup and hold times. A write cycle is defined by \overline{LW} or \overline{UW} low and \overline{ADSP} high for the setup and hold times.
2. All read and write cycle timings are referenced from K or \overline{G} .
3. \overline{G} is a don't care when \overline{UW} or \overline{LW} is sampled low.
4. Maximum access times are guaranteed for all possible Pentium external bus cycles.
5. Transition is measured $\pm 500 \text{ mV}$ from steady-state voltage with load of Figure 1B. This parameter is sampled rather than 100% tested. At any given voltage and temperature, t_{KHQZ} max is less than t_{KHQZ1} min for a given device and from device to device.
6. This is a synchronous device. All addresses must meet the specified setup and hold times for **ALL** rising edges of K whenever \overline{ADSP} or \overline{ADSC} is low, and the chip is selected. All other synchronous inputs must meet the specified setup and hold times for **ALL** rising edges of K when the chip is enabled. Chip enable must be valid at each rising edge of clock for the device (when \overline{ADSP} or \overline{ADSC} is low) to remain enabled.
