### **Multistandard Sound Processor Family**

### 1. Introduction

The MSP 44x8G family of Multistandard Sound Processors covers the sound processing of all analog TV-Standards worldwide, as well as the NICAM digital sound standards. The full TV sound processing, starting with analog sound IF signal-in, down to processed analog AF-out, is performed on a single chip. Fig. 1–1 shows a simplified functional block diagram of the MSP 44x8G.

The high-quality A/D and D/A converters offer the full audio bandwidth of 20 kHz and the backend DSP processing is performed at a 48 kHz sample rate.

The MSP 44x8G has been designed for the usage in hybrid set-top boxes and multimedia applications. Its asynchronous I<sup>2</sup>S slave interface allows the reception of digital stereo signals with arbitrary sample rates ranging from 5 to 50 kHz. Synchronization is performed by means of an adaptive sample rate converter.

This generation of TV sound processing ICs includes versions for processing the multichannel television sound (MTS) signal conforming to the standard recommended by the Broadcast Television Systems Committee (BTSC). The DBX noise reduction, or alternatively, Micronas Noise Reduction (MNR) is performed alignment free.

Other processed standards are the Japanese FM-FM multiplex standard (EIA-J) and the FM Stereo Radio standard.

The MSP 44x8G versions are pin and software compatible to other MSP families. Standard selection requires only a single I<sup>2</sup>C transmission.

The MSP 44x8G has built-in automatic functions: The IC is able to detect the actual sound standard automatically (Automatic Standard Detection). Furthermore, pilot levels and identification signals can be evaluated internally with subsequent switching between mono/stereo/bilingual; no I<sup>2</sup>C interaction is necessary (Automatic Sound Selection).

The ICs are produced in submicron CMOS technology and are available in the following packages: PQFP80, PLQFP64, and PSDIP64.

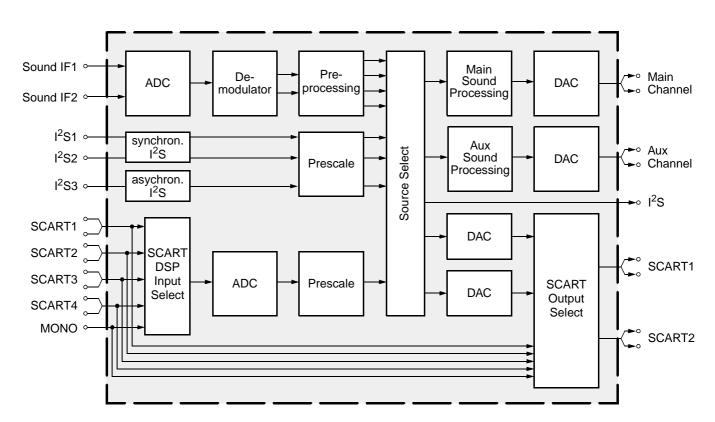

Fig. 1-1: Simplified functional block diagram of the MSP 44x8G

### MSP 44x8G

### 1.1. Features of the MSP 44x8G Family

Feature	4408	4418	4428	4448	4458
Standard Selection with single I <sup>2</sup> C transmission	Х	Х	Х	Х	Х
Automatic Standard Detection of terrestrial TV standards	Х	Х	Х	Х	Х
Automatic Sound Selection (mono/stereo/bilingual), new registers MODUS, STATUS	Х	Х	Х	Х	Х
Two selectable sound IF (SIF) inputs	Х	Х	Х	Х	Х
Automatic Carrier Mute function	Х	Х	Х	Х	Х
Interrupt output programmable (indicating status change)	Х	Х	Х	Х	Х
Main/Aux channel with volume, balance, bass, treble, loudness	Х	Х	Х	Х	Х
AVC: Automatic Volume Correction	Х	Х	Х	Х	Х
Two channel mixer	Х	Х	Х	Х	Х
Selectable preemphasis for Aux channel	Х	Х	Х	Х	Х
Four Stereo SCART (line) inputs, one Mono input; two Stereo SCART outputs	Х	Х	Х	Х	Х
Complete SCART in/out switching matrix	Х	Х	Х	Х	Х
Two 48kHz I <sup>2</sup> S inputs; one ansynchronous 550 kHz I <sup>2</sup> S input, one 48 kHz I <sup>2</sup> S output	Х	Х	Х	Х	Х
All analog FM-Stereo A2 and satellite standards; AM-SECAM L standard	Х	Х			Х
Simultaneous demodulation of (very) high-deviation FM-Mono and NICAM		Х			Х
Adaptive deemphasis for satellite (Wegener-Panda, acc. to ASTRA specification)	Х	Х			Х
ASTRA Digital Radio (ADR) together with DRP 3510A	Х	Х			Х
All NICAM standards		Х			Х
Demodulation of the BTSC multiplex signal and the SAP channel			Х	Х	Х
Alignment free digital DBX noise reduction for BTSC Stereo and SAP				Х	Х
Alignment free digital Micronas Noise Reduction (MNR) for BTSC Stereo and SAP			Х		
BTSC stereo and EIA-J separation significantly better than spec.			Х	Х	Х
SAP and stereo detection for BTSC system			Х	Х	Х
Korean FM-Stereo A2 standard	Х	Х	Х	Х	Х
Alignment-free Japanese standard EIA-J			Х	Х	Х
Demodulation of the FM-Radio multiplex signal			Х	Х	Х

### 1.2. MSP 44x8G Version List

Version	Status	Description
MSP 4408G	planned	FM Stereo (A2) Version
MSP 4418G	planned	NICAM and FM Stereo (A2) Version
MSP 4428G	planned	NTSC Version (A2 Korea, BTSC with Micronas Noise Reduction (MNR), and Japanese EIA-J system)
MSP 4448G	planned	NTSC Version (A2 Korea, BTSC with DBX noise reduction, and Japanese EIA-J system)
MSP 4458G	available	Global Version (all sound standards)

### 1.3. MSP 44x8G Versions and their Application Fields

Table 1–1 provides an overview of TV sound standards that can be processed by the MSP 44x8G family. In addition, the MSP 44x8G is able to handle the terrestrial FM-Radio standard. With the MSP 44x8G, a com-

plete multimedia receiver covering all TV sound standards together with terrestrial and satellite radio sound can be built; even ASTRA Digital Radio can be processed (with a DRP 3510A coprocessor).

Table 1–1: TV Stereo Sound Standards covered by the MSP 44x8G Family (details see Appendix A)

	MSP Version System		System	Position of Sound Carrier / MHz	Sound Modulation	Color System	Broadcast e.g. in:					
4408				B/G	5.5/5.7421875	FM-Stereo (A2)	PAL	Germany				
				B/G	5.5/5.85	FM-Mono/NICAM	PAL	Scandinavia, Spain				
				L	6.5/5.85	AM-Mono/NICAM	SECAM-L	France				
				1	6.0/6.552	FM-Mono/NICAM	PAL	UK, Hong Kong				
					6.5/5.85	FM-Mono/NICAM	PAL	China, Hungary				
		4418	4458		D/K	D/K	D/K	D/W	6.5/6.2578125	FM-Stereo (A2, D/K1)	SECAM-East	Slovak. Rep.
		4		D/K	6.5/6.7421875	FM-Stereo (A2, D/K2)	PAL	currently no broadcast				
					6.5/5.7421875	FM-Stereo (A2, D/K3)	SECAM-East	Poland				
4408			Satellite		6.5 7.02/7.2 7.38/7.56 etc.	FM-Mono FM-Stereo ASTRA Digital Radio (ADR) with DRP 3510A	PAL	Europe Sat. ASTRA				
					4.5/4.724212	FM-Stereo (A2)	NTSC	Korea				
	4428/48			М	4.5	FM-FM (EIA-J)	NTSC	Japan				
	442				4.5	BTSC-Stereo + SAP	NTSC	USA				
				FM-Radio	10.7	FM-Stereo Radio		USA, Europe				

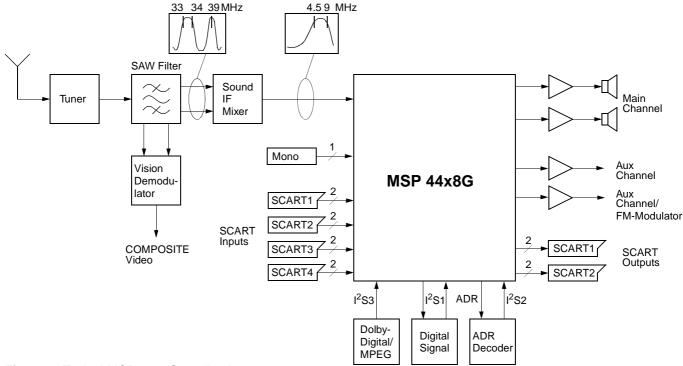

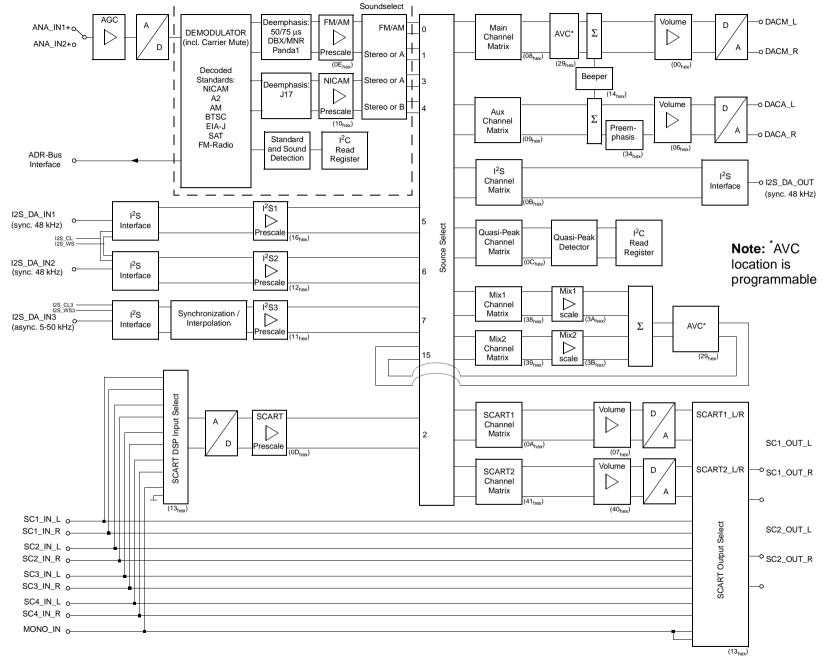

Fig. 1–2: Typical MSP 44x8G application

# **Functional Description**

# 2.1. Architecture of the MSP 44x8G Family

Fig. The 2-1 shows a simplified block diagram of the block diagram contains all features of the C.

MSP 4458G. Other members of the MSP 44x8G family do not have the complete set of features, handling only a subset of the standards (see dashed block in Fig. 2–1).

Automatic

Fig. 2-1: Signal flow block diagram of the MSP 44x8G (input and output names correspond to pin names).

### 2.2. MSP 44x8G Sound IF Processing

### 2.2.1. Analog Sound IF Input

The input pins ANA\_IN1+, ANA\_IN2+, and ANA\_IN-offer the possibility to connect two different sound IF (SIF) sources to the MSP 44x8G. The preselected sound IF signal is fed into an A/D-converter. An analog automatic gain circuit (AGC) allows a wide range of input levels. The highpass filters, formed by the coupling capacitors at pins ANA\_IN1+ and ANA\_IN2+ (see Section 7.3. "Application Circuit" on page 83), are sufficient in most cases to suppress video components. Some combinations of SAW filters and sound IF mixer ICs, however, show large picture components on their outputs. In this case, further filtering is recommended.

### 2.2.2. Demodulator: Standards and Features

The MSP 44x8G is able to demodulate all TV-sound standards worldwide including the digital NICAM system. Depending on the MSP 44x8G version, the following demodulation modes can be performed:

**A2 Systems:** Detection and demodulation of two separate FM carriers (FM1 and FM2), demodulation and evaluation of the identification signal of carrier FM2.

**NICAM Systems:** (Only possible in the MSP 4418G and MSP 4458G). Demodulation and decoding of the NICAM carrier, detection and demodulation of the analog FM or AM carrier. For D/K-NICAM, the FM carrier may have a maximum deviation of 384 kHz.

**Very high deviation FM-Mono:** Detection and robust demodulation of one FM carrier with a maximum deviation of 540 kHz.

**BTSC-Stereo:** Detection and FM demodulation of the aural carrier resulting in the MTS/MPX signal. Detection and evaluation of the pilot carrier, AM demodulation of the (L-R)-carrier and detection of the SAP subcarrier. Processing of DBX noise reduction or **Micronas Noise Reduction (MNR)**.

**BTSC-Mono + SAP:** Detection and FM demodulation of the aural carrier resulting in the MTS/MPX signal. Detection and evaluation of the pilot carrier, detection and FM demodulation of the SAP subcarrier. Processing of DBX noise reduction or Micronas Noise Reduction (MNR).

**Japan Stereo:** Detection and FM demodulation of the aural carrier resulting in the MPX signal. Demodulation and evaluation of the identification signal and FM demodulation of the (L–R)-carrier.

**FM-Satellite Sound:** Demodulation of one or two FM carriers. Processing of high-deviation mono or narrow bandwidth mono, stereo, or bilingual satellite sound according to the ASTRA specification.

**FM-Stereo-Radio:** Detection and FM demodulation of the aural carrier resulting in the MPX signal. Detection and evaluation of the pilot carrier and AM demodulation of the (L–R)-carrier.

The demodulator blocks of all MSP 44x8G versions have identical user interfaces. Even completely different systems like the BTSC and NICAM systems are controlled the same way. Standards are selected by means of MSP Standard Codes. Automatic processes handle standard detection and identification without controller interaction. The key features of the MSP 44x8G demodulator blocks are described below.

**Standard Selection:** The controlling of the demodulator is minimized: All parameters, such as tuning frequencies or filter bandwidth, are adjusted automatically by transmitting one single value to the STANDARD SELECT register. For all standards, specific MSP standard codes are defined.

**Automatic Standard Detection:** If the TV sound standard is unknown, the MSP 44x8G can automatically detect the actual standard, switch to that standard, and respond the actual MSP standard code.

Automatic Carrier Mute: To prevent noise effects or FM identification problems in the absence of an FM carrier, the MSP 44x8G offers a carrier mute feature, which is activated automatically if the standard is selected by means of the STANDARD SELECT register. If no FM carrier is available at one of the two MSP demodulator channels, the corresponding demodulator output is muted.

### 2.2.3. Preprocessing of Demodulator Signals

All demodulated signals must be processed by a deemphasis filter and adjusted in level (analog signals must also be dematrixed). The correct deemphasis filters are already selected by setting the standard in the STANDARD SELECT register. The level adjustment has to be done by means of the FM/AM and NICAM prescale registers. The necessary dematrix function depends on the selected sound standard and the actual broadcasted sound mode (mono, stereo, or bilingual). It can be manually set by the FM Matrix Mode register or automatically set by the Automatic Sound Selection.

### 2.2.4. Automatic Sound Select

In the Automatic Sound Select mode, the dematrix function is automatically selected based on the identification information in the STATUS register. No I<sup>2</sup>C interaction is necessary when the broadcasted sound mode changes (e.g. from mono to stereo).

The demodulator supports the identification check by switching between mono compatible standards (standards that have the same FM mono carrier) automatically and non-audible. If B/G-FM or B/G-NICAM is selected, the MSP will switch between these standards. The same action is performed for the standards: D/K1-FM, D/K2-FM, and D/K-NICAM. Switching is only done in the absence of any stereo or bilingual identification. If identification is found, the MSP keeps the detected standard.

In case of high bit-error rates, the MSP 44x8G automatically falls back from digital NICAM sound to analog FM or AM mono.

Table 2–1 on page 11 summarizes all actions that take place when Automatic Sound Select is switched on.

To provide more flexibility, the Automatic Sound Select block prepares four different source channels of demodulated sound (Fig. 2–2). By choosing one of the four demodulator channels, the preferred sound mode can be selected by means of the Source Select registers, independent for all MSP-outputs.

The following source channels of demodulated sound are defined:

- "FM/AM" channel: Analog mono sound, stereo if available. In case of NICAM, analog mono only (FM or AM mono).
- "Stereo or A/B" channel: Analog or digital mono sound, stereo if available. In case of bilingual broadcast, it contains both languages A (left) and B (right).
- "Stereo or A" channel: Analog or digital mono sound, stereo if available. In case of bilingual broadcast, it contains language A (on left and right).
- "Stereo or B" channel: Analog or digital mono sound, stereo if available. In case of bilingual broadcast, it contains language B (on left and right).

Fig. 2–2 and Table 2–2 show the source channel assignment of the demodulated signals in case of Automatic Sound Select mode for all sound standards (see Section 6.).

**Note:** The analog primary input channel contains the signal of the mono FM/AM carrier or the L+R signal of the MPX carrier. The secondary input channel contains the signal of the second FM carrier, the L-R signal of the MPX carrier, or the SAP signal.

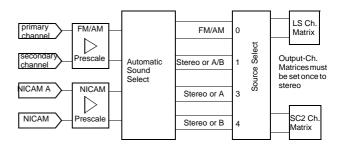

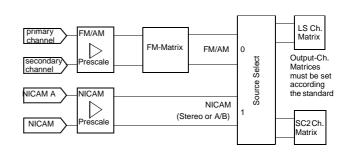

Fig. 2–2: Source channel assignment of demodulated signals in Automatic Sound Select Mode

### 2.2.5. Manual Mode

Fig. 2–3 shows the source channel assignment of demodulated signals in case of manual mode. If manual mode is required, more information can be found in Section 6.7. "Demodulator Source Channels in Manual Mode" on page 80.

**Fig. 2–3:** Source channel assignment of demodulated signals in Manual Mode

Table 2-1: Performed actions of the Automatic Sound Selection

Selected TV Sound Standard	Performed Actions
B/G-FM, D/K-FM, M-Korea, and M-Japan	Evaluation of the identification signal and automatic switching to mono, stereo, or bilingual. Preparing four demodulator source channels according to Table 2–2. Identification is acquired after 500 ms.
B/G-NICAM, L-NICAM, I-NICAM, and D/K-NICAM	Evaluation of NICAM-C-bits and automatic switching to mono, stereo, or bilingual. Preparing four demodulator source channels according to Table 2–2. NICAM detection is acquired within 150 ms.
	In case of bad or no NICAM reception, the MSP switches automatically to FM/AM mono and switches back to NICAM if possible. A hysteresis prevents periodical switching.
B/G-FM, B/G-NICAM or D/K1-FM, D/K2-FM, D/K-NICAM	Automatic searching for stereo/bilingual-identification in case of mono transmission. Automatic and non-audible changes between Dual-FM and FM-NICAM standards while listening to the basic FM-Mono sound carrier.  Example: If starting with B/G-FM-Stereo, there will be a periodical alternation to B/G-NICAM in the absence of FM-Stereo/Bilingual or NICAM-identification. Once an identification is detected, the MSP keeps the corresponding standard.
BTSC-STEREO, FM Radio	Evaluation of the pilot signal and automatic switching to mono or stereo. Preparing four demodulator source channels according to Table 2–2. Detection of the SAP carrier. Pilot detection is acquired after 200 ms.
BTSC-SAP	In the absence of SAP, the MSP switches to BTSC-Stereo if available. If SAP is detected, the MSP switches automatically to SAP (see Table 2–2).

Table 2–2: Sound modes for the demodulator source channels with Automatic Sound Select

			Source Channels in Automatic Sound Select Mode				
Broadcasted Sound Standard	Selected MSP Standard Code <sup>3)</sup>	Broadcasted Sound Mode	FM/AM (source select: 0)	Stereo or A/B (source select: 1)	Stereo or A (source select: 3)	Stereo or B (source select: 4)	
M-Korea	02	MONO	Mono	Mono	Mono	Mono	
B/G-FM D/K-FM	03, 08 <sup>1)</sup> 04, 05, 0B <sup>1)</sup>	STEREO	Stereo	Stereo	Stereo	Stereo	
M-Japan	30	BILINGUAL: Languages A and B	Left = A Right = B	Left = A Right = B	Α	В	
B/G-NICAM L-NICAM	08, 03 <sup>2)</sup> 09	NICAM not available or error rate too high	analog Mono	analog Mono	analog Mono	analog Mono	
I-NICAM D/K-NICAM	0A 0B, 04 <sup>2)</sup> , 05 <sup>2)</sup> 0C	MONO	analog Mono	NICAM Mono	NICAM Mono	NICAM Mono	
D/K-NICAM (with high		STEREO	analog Mono	NICAM Stereo	NICAM Stereo	NICAM Stereo	
deviation FM)		BILINGUAL: Languages A and B	analog Mono	Left = NICAM A Right = NICAM B	NICAM A	NICAM B	
	20, 21	MONO	Mono	Mono	Mono	Mono	
		STEREO	Stereo	Stereo	Stereo	Stereo	
	20	MONO+SAP	Mono	Mono	Mono	Mono	
BTSC		STEREO+SAP	Stereo	Stereo	Stereo	Stereo	
	21	MONO+SAP	Left = Mono Right = SAP	Left = Mono Right = SAP	Mono	SAP	
		STEREO+SAP	Left = Mono Right = SAP	Left = Mono Right = SAP	Mono	SAP	
FM Radio	40	MONO	Mono	Mono	Mono	Mono	
		STEREO	Stereo	Stereo	Stereo	Stereo	

The Automatic Sound Select process will automatically switch to the mono compatible analog standard.
 The Automatic Sound Select process will automatically switch to the mono compatible digital standard.
 The MSP Standard Codes are defined in Table 3–7 on page 20.

### 2.3. Preprocessing for SCART and I<sup>2</sup>S Input Signals

The SCART and  $I^2S$  inputs need only be adjusted in level by means of the SCART and  $I^2S$  prescale registers.

### 2.4. Source Selection and Output Channel Matrix

The Source Selector makes it possible to distribute all source signals (one of the demodulator source channels, SCART, or I<sup>2</sup>S input) to the desired output channels (Main, Aux, etc.). All input and output signals can be processed simultaneously. Each source channel is identified by a unique source address.

For each output channel, the output channel matrix can be set to sound A, sound B, stereo, or mono.

If Automatic Sound Select is on, the output channel matrix can stay fixed to stereo (transparent) for demodulated signals.

### 2.4.1. Mixing Unit

Any source can be selected as the input for the two channels of the Mixing unit. The mixer channel matrices and the scaling factors can be programmed separately for each channel.

After adding up both channels, the signal is fed back and is available as source 15 (Mix output) of the Source Selector.

### 2.5. Audio Baseband Processing

### 2.5.1. Automatic Volume Correction (AVC)

Different sound sources (e.g. terrestrial channels, SAT channels, or SCART) fairly often do not have the same volume level. Advertisements during movies usually have a higher volume level than the movie itself. This results in annoying volume changes. The AVC solves this problem by equalizing the volume level.

In the standard configuration the AVC block is located in the main channel. Alternatively, the AVC function can be moved to the mixer path.

To prevent clipping, the AVC's gain decreases quickly in dynamic boost conditions. To suppress oscillation effects, the gain increases rather slowly for low-level inputs. The decay time is programmable by the AVC register (see page 29).

For input signals ranging from -24 dBr to 0 dBr, the AVC maintains a fixed output level of -18 dBr. Fig. 2-4 shows the AVC output level versus its input level. For prescale and volume registers set to 0 dB, a level of 0 dBr corresponds to full scale input/output. This is

- SCART input/output 0 dBr = 2.0 V<sub>rms</sub>
- Main and Aux output 0 dBr = 1.4  $V_{rms}$

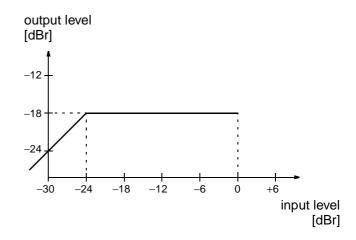

Fig. 2-4: Simplified AVC characteristics

### 2.5.2. Main and Aux Outputs

The Main and Aux output channels are adjustable in volume. A square wave beeper with adjustable frequency and volume can be added to them.

### 2.5.3. Quasi-Peak Detector

The Quasi-Peak Readout register can be used to read out the quasi-peak level of any input source. The feature is based on following filter time constants:

attack time: 1.3 msdecay time: 37 ms

### 2.6. SCART Signal Routing

### 2.6.1. SCART DSP In and SCART Out Select

The SCART DSP Input Select and SCART Output Select blocks include full matrix switching facilities. To design a TV set with four pairs of SCART-inputs and two pairs of SCART-outputs, no external switching hardware is required. The switches are controlled by the ACB user register (see page 31).

### 2.6.2. Stand-by Mode

If the MSP 44x8G is switched off by first pulling STANDBYQ low and then (after >1  $\mu s$  delay) switching off the 5-V, but keeping the 8-V power supply ('Standby'-mode), the SCART switches maintain their position and function. This allows the copying from selected SCART-inputs to SCART-outputs in the TV set's stand-by mode.

In case of power on or starting from stand-by (see details on the power-up sequence in Fig. 4–20 on page 56), all internal registers except the ACB register (page 31) are reset to the default configuration (see Table 3–5 on page 18). The reset position of the ACB register becomes active after the first  $\rm I^2C$  transmission into the Baseband Processing part (subaddress  $\rm 12_{hex}$ ). By transmitting the ACB register first, the reset state can be redefined.

### 2.7. I<sup>2</sup>S Bus Interfaces

The MSP 44x8G has two kinds of interfaces: synchronous master/slave input/output interfaces running on 48 kHz and an asynchronous slave interface.

The interfaces accept a variety of formats with different sample width, bit-orientation, and wordstrobe timing. All  $I^2S$  options are set by means of the MODUS or  $I^2S$ \_CONFIG register.

### 2.7.1. Synchronous I<sup>2</sup>S-Interface(s)

The synchronous  $I^2S$  bus interface consists of the pins:

- I2S\_DA\_IN1, I2S\_DA\_IN2/3 (I2S\_DA\_IN2 in PQFP80 package):
   I<sup>2</sup>S serial data input, 16, 18...32 bits per sample.
- I2S\_DA\_OUT:
   I<sup>2</sup>S serial data output, 16, 18...32 bits per sample.
- I2S\_CL:
   I<sup>2</sup>S serial clock.
- I2S\_WS:
   I<sup>2</sup>S word strobe signal defines the left and right sample.

If the MSP 44x8G serves as the master on the  $I^2S$  interface, the clock and word strobe lines are driven by the MSP. In this mode, only 16, 32 bits per sample can be selected. In slave mode, these lines are input to the MSP 44x8G and the MSP clock is synchronized to 384 times the I2S\_WS rate (48 kHz). NICAM operation is not possible in slave mode.

An  $I^2S$  timing diagram is shown in Fig. 4–22 on page 59.

### 2.7.2. Asynchronous I<sup>2</sup>S-Interface

The asynchronous  $I^2S$  slave interface allows the reception of digital stereo signals with arbitrary sample rates from 5 to 50 kHz. The synchronization is performed by means of an adaptive sample rate converter. No oversampling clock is required.

The following pins are used for the asynchronous I<sup>2</sup>S bus interface:

- I2S\_WS3 (serves only as input)
- I2S\_CL3 (serves only as input)
- I2S DA IN2/3 (I2S DA IN3 in PQFP80 package).

The interface accepts I<sup>2</sup>S-input streams with MSB first and with sample widths of 16,18...32 bits. With left/right alignment and wordstrobe timing polarity, there are additional parameters available for the adaption to a variety of formats in the I<sup>2</sup>S-CONFIG register (see page 24).

### 2.8. ADR Bus Interface

For the ASTRA Digital Radio System (ADR), the MSP 4408G, MSP 4418G, and MSP 4458G performs preprocessing such as carrier selection and filtering. Via the 3-line ADR-bus, the resulting signals are transferred to the DRP 3510A coprocessor, where the source decoding is performed. To be prepared for an upgrade to ADR with an additional DRP board, the following lines of MSP 44x8G should be provided on a feature connector:

- AUD\_CL\_OUT
- I2S\_DA\_IN1, 2, or 3
- I2S\_DA\_OUT, I2S\_WS, I2S\_CL
- ADR\_CL, ADR\_WS, ADR\_DA

For more details, please refer to the DRP 3510A data sheet.

### 2.9. Digital Control I/O Pins and Status Change Indication

The static level of the digital input/output pins D\_CTR\_I/O\_0/1 is switchable between HIGH and LOW via the I<sup>2</sup>C-bus by means of the ACB register (see page 31). This enables the controlling of external hardware switches or other devices via I<sup>2</sup>C-bus.

The digital input/output pins can be set to high impedance by means of the MODUS register (see page 23). In this mode, the pins can be used as input. The current state can be read out of the STATUS register (see page 25).

Optionally, the pin D\_CTR\_I/O\_1 can be used as an interrupt request signal to the controller, indicating any changes in the read register STATUS. This makes polling unnecessary, I<sup>2</sup>C bus interactions are reduced to a minimum (see "STATUS Register" on page 25 and "MODUS Register" on page 23).

### 2.10. Preemphasis

When using the Aux output for feeding an external modulator, a preemphasis can be applied to the right channel.

The signal is scaled down by -3 dB. An overmodulation protection is included in the algorithm which limits the output signal to 0 dBFS. Due to the nature of a preemphasis, its gain at high frequencies exceeds 3 dB. Thus, even with 0 dB input signals and prescaler / volume set to 0 dB, clipping can occur.

There are three modes present: preemphasis off, 50  $\mu$ s, and 75  $\mu$ s. (see Table 3–11on page 29) for the register settings.

### 2.11. Clock PLL Oscillator and Crystal Specifications

The MSP 44x8G derives all internal system clocks from the 18.432 MHz oscillator. In NICAM or in I<sup>2</sup>S-Slave mode of the synchronous interface, the clock is phase-locked to the corresponding source. Therefore, it is not possible to use NICAM and I<sup>2</sup>S-Slave mode of the synchronous interface at the same time.

For proper performance, the MSP clock oscillator requires a 18.432-MHz crystal. Note that for the phase-locked modes (NICAM, I<sup>2</sup>S-Slave), crystals with tighter tolerance are required. Please note also, that the asynchronous I<sup>2</sup>S3 slave interface uses a different locking mechanism and does not require tighter crystal tolerances.

### Remark on using the crystal:

External capacitors at each crystal pin to ground are required. They are necessary for tuning the open-loop frequency of the internal PLL and for stabilizing the frequency in closed-loop operation. The higher the capacitors, the lower the resulting clock frequency. The nominal free running frequency should match 18.432 MHz as closely as possible.

Clock measurements should be done at pin AUD\_CL\_OUT. This pin must be activated for this purpose (see MODUS register on page 23).

### 3. Control Interface

### 3.1. I<sup>2</sup>C Bus Interface

### 3.1.1. Device and Subaddresses

The MSP 44x8G is controlled via the I<sup>2</sup>C bus slave interface.

The IC is selected by transmitting one of the MSP 44x8G device addresses. In order to allow up to three MSP ICs to be connected to a single bus, an address select pin (ADR\_SEL) has been implemented. With ADR\_SEL pulled to high, low, or left open, the MSP 44x8G responds to different device addresses. A device address pair is defined as a write address and a read address (see Table 3–1).

Writing is done by sending the device write address, followed by the subaddress byte, two address bytes, and two data bytes. Reading is done by sending the write device address, followed by the subaddress byte and two address bytes. Without sending a stop condition, reading of the addressed data is completed by sending the device read address and reading two bytes of data. Refer to Section 3.1.2. for the I<sup>2</sup>C bus protocol and to Section 3.4. "Programming Tips" on page 34 for proposals of MSP 44x8G I<sup>2</sup>C telegrams. See Table 3–2 for a list of available subaddresses.

Besides the possibility of hardware reset, the MSP can also be reset by means of the RESET bit in the CONTROL register by the controller via  $\rm I^2C$  bus.

Due to the internal architecture of the MSP 44x8G, the IC cannot react immediately to an I<sup>2</sup>C request. The typical response time is about 0.3 ms. If the MSP cannot accept another complete byte of data until it has performed some other function (for example, servicing an internal interrupt), it will hold the clock line I2C\_CL low to force the transmitter into a wait state. The positions within a transmission where this may happen are indicated by "Wait" in Section 3.1.3. The maximum wait period of the MSP during normal operation mode is less than 1 ms.

### Internal hardware error handling:

In case of any internal hardware error (e.g. interruption of the power supply of the MSP), the MSP's wait period is extended to 1.8 ms. After this time period elapses, the MSP releases data and clock lines.

### Indication and solving of the error status:

To indicate the error status, the remaining acknowledge bits of the actual I<sup>2</sup>C-protocol will be left high. Additionally, bit[14] of CONTROL is set to one. The MSP can then be reset via the I<sup>2</sup>C bus by transmitting the reset condition to CONTROL.

### Indication of reset:

Any reset, even caused by an unstable reset line etc., is indicated in bit[15] of CONTROL.

A general timing diagram of the  $I^2C$  Bus is shown in Fig. 4–21 on page 57.

Table 3-1: I<sup>2</sup>C Bus Device Addresses

ADR_SEL	Low		High		Left Open	
Mode	Write	Read	Write	Read	Write	Read
MSP device address	80 <sub>hex</sub>	81 <sub>hex</sub>	84 <sub>hex</sub>	85 <sub>hex</sub>	88 <sub>hex</sub>	89 <sub>hex</sub>

Table 3-2: I<sup>2</sup>C Bus Subaddresses

Name	Binary Value	Hex Value	Mode	Function
CONTROL	0000 0000	00	Read/Write	Write: Software reset of MSP (see Table 3–3) Read: Hardware error status of MSP
TEST	0000 0001	01	Write	only for internal use
WR_DEM	0001 0000	10	Write	write address demodulator
RD_DEM	0001 0001	11	Write	read address demodulator
WR_DSP	0001 0010	12	Write	write address DSP
RD_DSP	0001 0011	13	Write	read address DSP

### MSP 44x8G

### 3.1.2. Description of CONTROL Register

Table 3-3: CONTROL as a Write Register

Name	Subaddress	Bit[15] (MSB)	Bits[14:0]
CONTROL	00 <sub>hex</sub>	1 : RESET 0 : normal	0

### Table 3-4: CONTROL as a Read Register

Name	Subaddress	Bit[15] (MSB)	Bit[14]	Bits[13:0]			
CONTROL	00 <sub>hex</sub>	Reset status after last reading of CONTROL: 0 : no reset occured 1 : reset occured	Internal hardware status: 0 : no error occured 1 : internal error occured	not of interest			
Reading of CONTROL will reset the bits[15,14] of CONTROL. After Power-on, bit[15] of CONTROL will be set; it must be							

read once to be reset.

### 3.1.3. Protocol Description

Write to DSP or Demodulator

5	write	Wait	ACK	sub-addr	ACK	addr-byte	ACK	addr-byte	ACK	data-byte-	ACK	data-byte	ACK	Р
	device					high		low		high		low		
	address	3												

### Read from DSP or Demodulator

ſ	S	write	Wait	ACK	sub-addr	ACK	addr-byte	ACK	addr-byte	ACK	S	read	Wait	ACK	data-byte-	ACK	data-byte	NAK	Р
		device					high		low			device			high		low		
		address										address							

### Write to Control or Test Registers

S	write device address		ACK	sub-addr	ACK	data-byte high	ACK	data-byte low	ACK	Р	
---	----------------------------	--	-----	----------	-----	-------------------	-----	------------------	-----	---	--

Note: S = I<sup>2</sup>C-Bus Start Condition from master

I<sup>2</sup>C-Bus Stop Condition from master

ACK = Acknowledge-Bit: LOW on I2C\_DA from slave (= MSP, light gray) or master (= controller, dark gray)

NAK = Not Acknowledge-Bit: HIGH on I2C\_DA from master (dark gray) to indicate 'End of Read'

or from MSP indicating internal error state

Wait =  $I^2$ C-Clock line is held low, while the MSP is processing the  $I^2$ C command.

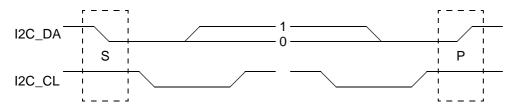

Fig. 3–1: I<sup>2</sup>C bus protocol (MSB first; data must be stable while clock is high)

### 3.1.4. Proposals for General MSP 44x8G I<sup>2</sup>C Telegrams

### 3.1.4.1. Symbols

daw write device address (80<sub>hex</sub>, 84<sub>hex</sub> or 88<sub>hex</sub>)

							source to NICAM and
							Matrix to STEREO

More examples of typical application protocols are listed in Section 3.4. "Programming Tips" on page 34.

### 3.2. Start-Up Sequence: Power-Up and I<sup>2</sup>C Controlling

After POWER ON or RESET (see Fig. 4–20 on page 56), the IC is in an inactive state. All registers are in the reset position (seeTable 3–5 and Table 3–6), the analog outputs are muted. The controller has to initialize all registers for which a non-default setting is necessary.

### 3.3. MSP 44x8G Programming Interface

### 3.3.1. User Registers Overview

The MSP 44x8G is controlled by means of user registers. The complete list of all user registers is given in the following tables. The registers are partitioned into the demodulator section (subaddress  $10_{\rm hex}$  for writing,  $11_{\rm hex}$  for reading) and the baseband processing sections (subaddress  $12_{\rm hex}$  for writing,  $13_{\rm hex}$  for reading).

Write and read registers are 16-bit wide, whereby the MSB is denoted bit[15]. Transmissions via I<sup>2</sup>C bus have to take place in 16-bit words (two byte transfers, with the most significant byte transferred first). All write registers, except the demodulator write registers, are readable.

Unused parts of the 16-bit write registers must be zero. Addresses not given in this table must not be written.

An overview of all MSP 44x8G write registers is shown in Table 3–5; all read registers are given in Table 3–6.

Additional read and write registers, together with a detailed description of the manual mode, can be found in the "Appendix B: Manual Mode" on page 73.

### MSP 44x8G

Table 3–5: List of MSP 44x8G Write Registers

### 3.3.2. Description of User Registers

Table 3-7: Standard Codes for STANDARD SELECT register

MSP Standard Code (Data in hex)	TV Sound Standard	Sound Carrier Frequencies in MHz	MSP 44x8G Version
	Automatic Standard Detect	ion	-1
00 01	Start Automatic Standard Detection		all
	Standard Selection		•
00 02	M-Dual FM-Stereo	4.5/4.724212	4408, 4418, 4448, 4458
00 03	B/G-Dual FM-Stereo <sup>1)</sup>	5.5/5.7421875	4408, 4418, 4458
00 04	D/K1-Dual FM-Stereo <sup>2)</sup>	6.5/6.2578125	
00 05	D/K2-Dual FM-Stereo <sup>2)</sup>	6.5/6.7421875	
00 06	D/K-FM-Mono with HDEV3 <sup>3)</sup> , not detectable by Automatic Standard Detection, for China HDEV3 <sup>3)</sup> SAT-Mono (i.e. Eutelsat, see Table 6–12)	6.5	
00 07	D/K3-Dual FM-Stereo	6.5/5.7421875	4408, 4418, 4458
80 00	B/G-NICAM-FM <sup>1)</sup>	5.5/5.85	4418, 4458
00 09	L-NICAM-AM	6.5/5.85	
00 0A	I-NICAM-FM	6.0/6.552	
00 0B	D/K-NICAM-FM <sup>2)</sup>	6.5/5.85	
00 0C	D/K-NICAM-FM with HDEV2 <sup>4)</sup> , not detectable by Automatic Standard Detection, for China	6.5/5.85	
00 0D	D/K-NICAM-FM with HDEV3 <sup>3)</sup> , not detectable by Automatic Standard Detection, for China	6.5/5.85	4418, 4458
00 20	BTSC-Stereo	4.5	4438, 4448, 4458
00 21	BTSC-Mono + SAP		
00 30	EIA-J Japan Stereo	4.5	4448, 4458
00 40	FM-Stereo Radio	10.7	4438, 4448, 4458
00 50	SAT-Mono (see Table 6–12)	6.5	4408, 4418, 4458
00 51	SAT-Stereo (see Table 6–12)	7.02/7.20	4408, 4418, 4458
00 60	SAT ADR (Astra Digital Radio)	6.12	4408, 4418, 4458

 <sup>1)</sup> In case of Automatic Sound Select, the B/G-codes 3<sub>hex</sub> and 8<sub>hex</sub> are equivalent.
 2) In case of Automatic Sound Select, the D/K-codes 4<sub>hex</sub>, 5<sub>hex</sub>, 7<sub>hex</sub> and B<sub>hex</sub> are equivalent.
 3) HDEV3: Max. FM deviation must not exceed 540 kHz
 4) HDEV2: Max. FM deviation must not exceed 360 kHz

### 3.3.2.1. STANDARD SELECT Register

The TV sound standard of the MSP 44x8G demodulator is determined by the STANDARD SELECT register. There are two ways to use the STANDARD SELECT register:

- Setting up the demodulator for a TV sound standard by sending the corresponding standard code with a single I<sup>2</sup>C-Bus transmission.
- Starting the Automatic Standard Detection for terrestrial TV standards. This is the most comfortable way to set up the demodulator. Within 0.5 s, the detection and set-up of the actual TV sound standard is performed. The detected standard can be read out of the STANDARD RESULT register by the control processor. This feature is recommended for the primary set-up of a TV set. Outputs should be muted during Automatic Standard Detection.

The Standard Codes are listed in Table 3-7.

Selecting a TV sound standard via the STANDARD SELECT register initializes the demodulator. This includes: AGC, tuning frequency, band-pass filters, demodulation mode (FM, AM, or NICAM), carrier mute, deemphasis, and identification mode.

If a present sound standard is impossible for a specific MSP version, it switches to the analog mono sound of this standard. In that case, stereo or bilingual processing will not be possible.

For a complete setup of the TV sound processing from analog IF input to the source selection, the following transmissions are necessary: MODUS register, STAN-DARD SELECT register, prescale values, FM matrix.

**Note:** The FM matrix is set automatically if Automatic Sound Select is active (MODUS[0]=1). In this case, the FM matrix will be initialized with "Sound A Mono". During operation, the FM matrix will be automatically selected according to the actual identification information.

### 3.3.2.2. STANDARD RESULT Register

If Automatic Standard Detection is selected in the STANDARD SELECT register, status and result of the Automatic Standard Detection process can be read out of the STANDARD RESULT register. The possible results are based on the mentioned Standard Code and are listed in Table 3–8.

In cases where no sound standard has been detected (no standard present, too much noise, strong interferers, etc.) the STANDARD RESULT register contains 00  $00_{\text{hex}}$ . In that case, the controller has to start further actions (for example, set the standard according to a preference list or by manual input).

As long as the STANDARD RESULT register contains a value greater than 07 FF $_{\rm hex}$ , the Automatic Standard Detection is still active. During this period, the MODUS and STANDARD SELECT register must not be written. The STATUS register will be updated when the Automatic Standard Detection has finished.

If a present sound standard is impossible for a specific MSP version, it detects and switches to the analog mono sound of this standard.

### Example:

The MSPs 4438G and 4448G will detect a B/G-NICAM signal as standard 3 and will switch to the analog FM-Mono sound.

**Table 3–8:** Results of the Automatic Standard Detection

Broadcasted Sound Standard	STANDARD RESULT Register Read 007E <sub>hex</sub>
Automatic Standard Detection could not find a sound standard	0000 <sub>hex</sub>
B/G-FM	0003 <sub>hex</sub>
B/G-NICAM	0008 <sub>hex</sub>
1	000A <sub>hex</sub>
FM-Radio	0040 <sub>hex</sub>
M-FM FIA-J	0002 <sub>hex</sub> (if MODUS[14,13]=00)

### 3.3.2.4. Read Registers on $I^2C$ Subaddress $11_{hex}$

Table 3–10: Read Registers on I<sup>2</sup>C Subaddress 11<sub>hex</sub>

Register Address	Function	1		Name			
STANDAR	STANDARD RESULT						
00 7E <sub>hex</sub>	STANDA	RD RESUL	T Register	STANDARD_RES			
	Readbac	k of the det	ected TV Sound or FM-Radio Standard				
	bit[15:0]	00 00 <sub>hex</sub>	Automatic Standard Detection could not find a sound standard MSP Standard Codes (see Table 3–8)				
		00 40 <sub>hex</sub> >07 FF <sub>hex</sub>	Automatic Standard Detection still active				
STATUS							
02 00 <sub>hex</sub>	STATUS	Register		STATUS			
	Contains	all user rele	evant internal information about the status of the MSP				
	bit[15:10	]	undefined				
	bit[8]	0/1	"1" indicates bilingual sound mode or SAP present				
	bit[7]	0/1	"1" indicates independent mono sound (only for NICAM on MSP 4418G and MSP 4458G)				
	bit[6]	0/1	mono/stereo indication				
	bit[5,9]	00 01 10 11	analog sound standard (FM or AM) active this pattern will not occur digital sound (NICAM) available (MSP 4418G and MSP 4458G only) bad reception condition of digital sound (NICAM) due to: a. high error rate b. unimplemented sound code c. data transmission only				
	bit[4]	0/1	low/high level of digital I/O pin D_CTR_I/O_1				
	bit[3]	0/1	low/high level of digital I/O pin D_CTR_I/O_0				
	bit[2]	0 1	detected secondary carrier (2nd A2 or SAP carrier) no secondary carrier detected				
	bit[1]	0 1	detected primary carrier (Mono or MPX carrier) no primary carrier detected				
	bit[0]		undefined				
	change i	If STATUS change indication is activated by means of MODUS[1]: Each change in the STATUS register sets the digital I/O pin D_CTR_I/O_1 to high level. Reading the STATUS register resets D_CTR_I/O_1.					

### 3.3.2.5. Write Registers on $I^2C$ Subaddress $12_{\text{hex}}$

Table 3–11: Write Registers on I<sup>2</sup>C Subaddress 12<sub>hex</sub>

Register Address	Function	Name					
PREPROC	PREPROCESSING						
00 0E <sub>hex</sub>	FM/AM P	rescale		PRE_FM			
	bit[15:8]	00 <sub>hex</sub> 7F <sub>hex</sub>	Defines the input prescale gain for the demodulated FM or AM signal				
		00 <sub>hex</sub>	off (RESET condition)				
			scept satellite FM, the combinations of prescale value and below lead to internal full scale.				
	FM mode	•					
	bit[15:8]	7F <sub>hex</sub> 48 <sub>hex</sub> 30 <sub>hex</sub> 24 <sub>hex</sub> 18 <sub>hex</sub>	28 kHz FM deviation 50 kHz FM deviation 75 kHz FM deviation 100 kHz FM deviation 150 kHz FM deviation 180 kHz FM deviation (limit)				
	FM high o	deviation m	ode (HDEV2, MSP Standard Code = C <sub>hex</sub> )				
	bit[15:8]	30 <sub>hex</sub> 14 <sub>hex</sub>	150 kHz FM deviation 360 kHz FM deviation (limit)				
	FM very h	nigh deviati	on mode (HDEV3, MSP Standard Code = 6)				
	bit[15:8]	20 <sub>hex</sub> 1A <sub>hex</sub>	450 kHz FM deviation 540 kHz FM deviation (limit)				
	Satellite F	FM with ada	aptive deemphasis				
	bit[15:8]	10 <sub>hex</sub>	recommendation				
	AM mode	e (MSP Sta	ndard Code = 9)				
	bit[15:8]	7C <sub>hex</sub>	recommendation for SIF input levels from 0.1 $\rm V_{pp}$ to 0.8 $\rm V_{pp}$				
			(Due to the AGC switched on, the AM-output level remains stable and independent of the actual SIF-level in the mentioned input range)				

**Table 3–11:** Write Registers on  $I^2C$  Subaddress  $12_{\text{hex}}$ , continued

Register Address	Function	Name
(continued)	FM Matrix Modes	FM_MATRIX
00 0E <sub>hex</sub>	Defines the dematrix function for the demodulated FM signal	
	bit[7:0] 00 <sub>hex</sub> no matrix (used for bilingual and unmatrixed stereo sound) 01 <sub>hex</sub> German stereo (Standard B/G) 02 <sub>hex</sub> Korean stereo (also used for BTSC, EIA-J, and FM Radio) sound A mono (left and right channel contain the mono sound of the FM/AM mono carrier) sound B mono (i.e. SAP)	
	In case of <b>Automatic Sound Select</b> , the FM Matrix Mode is set automatically, i.e. the low-part of any $I^2C$ transmission to the register 00 $0E_{hex}$ is ignored.	
	To enable a <b>Forced Mono Mode</b> for all analog stereo systems by overriding the internal pilot or identification evaluation, the following steps must be transmitted:	
	<ol> <li>MODUS with bit[0] = 0 (Automatic Sound Select off)</li> <li>FM Presc./Matrix with FM Matrix = Sound A Mono (SAP: Sound B Mono)</li> <li>Select FM/AM source channel, with channel matrix set to "Stereo" (transparent)</li> </ol>	
00 10 <sub>hex</sub>	NICAM Prescale	PRE_NICAM
	Defines the input prescale value for the digital NICAM signal	
	bit[15:8] 00 <sub>hex</sub> 7F <sub>hex</sub> prescale gain	
	examples:	
	00 <sub>hex</sub> off 20 <sub>hex</sub> 0 dB gain 5A <sub>hex</sub> 9 dB gain (recommendation) 7F <sub>hex</sub> +12 dB gain (maximum gain)	
00 16 <sub>hex</sub> 00 12 <sub>hex</sub> 00 11 <sub>hex</sub>	I2S1 Prescale I2S2 Prescale I2S3 Prescale	PRE_I2S1 PRE_I2S2 PRE_I2S3
	Defines the input prescale value for digital I <sup>2</sup> S input signals	
	bit[15:8] 00 <sub>hex</sub> 7F <sub>hex</sub> prescale gain	
	examples:  00 <sub>hex</sub> off  10 <sub>hex</sub> 0 dB gain (recommendation)  7F <sub>hex</sub> +18 dB gain (maximum gain)	
00 0D <sub>hex</sub>	SCART Input Prescale	PRE_SCART
	Defines the input prescale value for the analog SCART input signal	
	bit[15:8] 00 <sub>hex</sub> 7F <sub>hex</sub> prescale gain	
	examples:  00 <sub>hex</sub> off  19 <sub>hex</sub> 0 dB gain (2 V <sub>RMS</sub> input leads to digital full scale)  7F <sub>hex</sub> +14 dB gain (400 mV <sub>RMS</sub> input leads to digital full scale)

### 3.4. Programming Tips

This section describes the preferred method for initializing the MSP 44x8G. The initialization is grouped into four sections:

- SCART Signal Path (analog signal path)
- Demodulator Input
- SCART and I<sup>2</sup>S Inputs
- Output Channels

See Fig. 2-1 on page 8 for a complete signal flow.

### **SCART Signal Path**

- Select analog input for the SCART baseband processing (SCART DSP Input Select) by means of the ACB register.
- Select the source for each analog SCART output (SCART Output Select) by means of the ACB register.

### **Demodulator Input**

For a complete setup of the sound processing from analog IF input to the source selection, the following steps must be performed:

- Set MODUS register to the preferred mode and Sound IF input.
- 2. Write STANDARD SELECT register.
- 3. Choose preferred prescale (FM and NICAM) values.
- If Automatic Sound Select is not active: Choose FM matrix repeatedly according to the sound mode indicated in the STATUS register.

### SCART and I<sup>2</sup>S Inputs

- 1. Select preferred prescale for SCART.
- 2. Select preferred prescale for I<sup>2</sup>S inputs (set to 0 dB after RESET).

### **Output Channels**

- 1. Select the source channel and matrix for each output channel.
- 2. Set audio baseband features (i.e. AVC, 75  $\mu s$  preemphasis)
- 3. Select volume for each output channel.

### 3.5. Examples of Minimum Initialization Codes

Initialization of the MSP 44x8G according to these listings reproduces sound of the selected standard on the main output. All numbers are hexadecimal. The examples have the following structure:

- 1. Perform an I<sup>2</sup>C controlled reset of the IC.
- Write MODUS register (with Automatic Sound Select).
- Set Source Selection for main channel (with matrix set to STEREO).
- Set Prescale (FM and/or NICAM and dummy FM matrix).
- 5. Write STANDARD SELECT register.
- 6. Set Volume main channel to 0 dB.

### 3.5.1. B/G-FM (A2 or NICAM)

```
<80 00 80 00>  // Softreset
<80 00 00 00>  // MODUS-Register: Automatic = on
<80 10 00 30 20 03>  // MODUS-Register: Automatic = on
<80 12 00 08 03 20>  // Source Sel. = (St or A) & Ch. Matr. = St
<80 12 00 0E 24 03>  // FM/AM-Prescale = 24<sub>hex</sub>, FM-Matrix = MONO/SOUNDA
<80 12 00 10 00 5A>  // NICAM-Prescale = 5A<sub>hex</sub>
<80 10 00 20 00 03>  // Standard Select: A2 B/G or NICAM B/G or
<80 10 00 20 00 08>
<80 12 00 00 73 00>  // Main Volume 0 dB
```

### 3.5.2. BTSC-Stereo

```
<80 00 80 00> // Softreset
<80 00 00 00>
<80 10 00 30 20 03> // MODUS-Register: Automatic = on
<80 12 00 08 03 20> // Source Sel. = (St or A) & Ch. Matr. = St
<80 12 00 0E 24 03> // FM/AM-Prescale = 24<sub>hex</sub>, FM-Matrix = Sound A Mono
<80 10 00 20 00 20> // Standard Select: BTSC-STEREO
<80 12 00 00 73 00> // Main Volume 0 dB
```

### 3.5.3. BTSC-SAP with SAP at Main Channel

```
<80 00 80 00> // Softreset
<80 00 00 00> // MODUS-Register: Automatic = on
<80 10 00 30 20 03> // MODUS-Register: Automatic = on
<80 12 00 08 04 20> // Source Sel. = (St or B) & Ch. Matr. = St
<80 12 00 0E 24 03> // FM/AM-Prescale = 24<sub>hex</sub>, FM-Matrix = Sound A Mono
<80 10 00 20 00 21> // Standard Select: BTSC-SAP
<80 12 00 00 73 00> // Main Volume 0 dB
```

### 3.5.4. FM-Stereo Radio

```
<80 00 80 00> // Softreset
<80 00 00 00> // MODUS-Register: Automatic = on
<80 10 00 30 20 03> // MODUS-Register: Automatic = on
<80 12 00 08 03 20> // Source Sel. = (St or A) & Ch. Matr. = St
<80 12 00 0E 24 03> // FM/AM-Prescale = 24<sub>hex</sub>, FM-Matrix = Sound A Mono
<80 10 00 20 00 40> // Standard Select: FM-STEREO-RADIO
<80 12 00 00 73 00> // Main Volume 0 dB
```

### 3.5.5. Automatic Standard Detection

A detailed software flow diagram is shown in Fig. 3–2 on page 36.

```
<80 00 80 00>  // Softreset
<80 00 00 00>  // MODUS-Register: Automatic = on
<80 10 00 30 20 03>  // MODUS-Register: Automatic = on

### 3.5.6. Software Flow for Interrupt driven STATUS Check

A detailed software flow diagram is shown in Fig. 3–2 on page 36.

If the D\_CTR\_I/O\_1 pin of the MSP 44x8G is connected to an interrupt input pin of the controller, the following interrupt handler can be applied to be automatically called with each status change of the MSP 44x8G. The interrupt handler may adjust the display according to the new status information.

```
Interrupt Handler:
```

```
<80 11 02 00 <81 dd dd> // Read STATUS
// adjust display with given status information
// Return from Interrupt
```

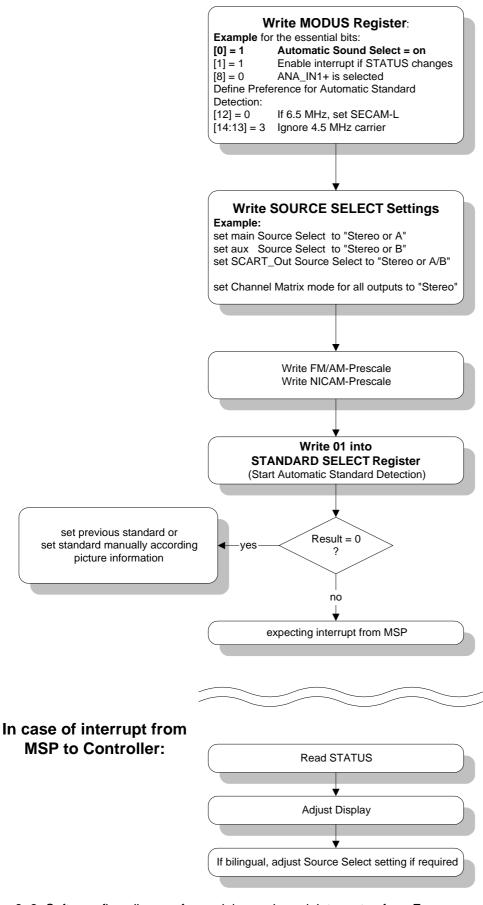

Fig. 3–2: Software flow diagram for a minimum demodulator setup for a European multistandard set applying the Automatic Sound Select feature

#### 4.3. Pin Descriptions

Pin numbers refer to the 80-pin PQFP package.

Pin 1, NC - Pin not connected.

Pin 2,  $I2C_CL - I^2C$  Clock Input/Output (Fig. 4–8) Via this pin, the  $I^2C$ -bus clock signal has to be supplied. The signal can be pulled down by the MSP in case of wait conditions.

Pin 3, **I2C\_DA** – I<sup>2</sup>C Data Input/Output (Fig. 4–8) Via this pin, the I<sup>2</sup>C-bus data is written to or read from the MSP.

Pin 4, **I2S\_CL** – I<sup>2</sup>S Clock Input/Output (Fig. 4–11) Clock line for the synchronous I<sup>2</sup>S bus. In master mode, this line is driven by the MSP; in slave mode, an external I<sup>2</sup>S clock has to be supplied.

Pin 5, **I2S\_WS** – I<sup>2</sup>S Word Strobe Input/Output (Fig. 4–11)

Word strobe line for the synchronous I<sup>2</sup>S bus. In master mode, this line is driven by the MSP; in slave mode, an external I<sup>2</sup>S word strobe has to be supplied.

Pin 6, **I2S\_DA\_OUT1** – I<sup>2</sup>S Data Output (Fig. 4–7) Output of digital serial sound data of the MSP on the synchronous I<sup>2</sup>S bus.

Pin 7, I2S\_DA\_IN1 –  $I^2$ S Data Input 1 (Fig. 4–9) First input of digital serial sound data to the MSP via the synchronous  $I^2$ S bus.

Pin 8, **ADR\_DA** – ADR Bus Data Output (Fig. 4–7) Output of digital serial data to the DRP 3510A via the ADR bus.

Pin 9, **ADR\_WS** – ADR Bus Word Strobe Output (Fig. 4–7)

Word strobe output for the ADR bus.

Pin 10, **ADR\_CL** – ADR Bus Clock Output (Fig. 4–7) Clock line for the ADR bus.

Pins 11, 12, 13, **DVSUP\*** – Digital Supply Voltage Power supply for the digital circuitry of the MSP. Must be connected to a +5 V power supply.

Pins 14, 15, 16, **DVSS\*** – Digital Ground Ground connection for the digital circuitry of the MSP.

Pin 17, **I2S\_DA\_IN2** – I<sup>2</sup>S Data Input 2 (Fig. 4–9) Second input of digital serial sound data to the MSP via the synchronous I<sup>2</sup>S bus. In all packages except PQFP80, this pin is also connected to the asynchronous I<sup>2</sup>S interface 3.

Pins 18, NC - Pin not connected.

Pins 19,  $I2S\_CL3 - I^2S$  Clock Input (Fig. 4–9) Clock line for the asynchronous  $I^2S$  bus. Since only a slave mode is available an external  $I^2S$  clock has to be supplied.

Pins 20, **I2S\_WS3** – I<sup>2</sup>S Word Strobe Input (Fig. 4–9) Word strobe line for the asynchronous I<sup>2</sup>S bus. Since only a slave mode is available an external I<sup>2</sup>S word strobe has to be supplied.

Pin 21, **RESETQ** – Reset Input (Fig. 4–9) In the steady state, high level is required. A low level resets the MSP 44x8G.

Pin 22, **I2S\_DA\_IN3** – I<sup>2</sup>S Data Input 3 (Fig. 4–9) Input of digital serial sound data to the MSP via the asynchronous I<sup>2</sup>S bus. In all packages except PQFP80, this pin is also connected to synchronous I<sup>2</sup>S interface 2.

Pins 23, NC - Pin not connected.

Pins 24, 25, **DACA\_R/L** – Aux Outputs (Fig. 4–17) Output of the Aux signal. A 1 nF capacitor to AHVSS must be connected to these pins. The DC offset on these pins depends on the selected Aux volume.

Pin 26, **VREF2** – Reference Ground 2 Reference analog ground. This pin must be connected separately to the ground (AHVSS). VREF2 serves as a

clean ground and should be used as the reference for analog connections to the Main and Aux outputs.

Pins 27, 28, **DACM\_R/L** – Main Outputs (Fig. 4–17)

Output of the Main signal. A 1 nF capacitor to AHVSS must be connected to these pins. The DC offset on these pins depends on the selected Main volume.

Pin 29, 30, 31, 32 NC - Pin not connected.

Pins 33, 34, **SC2\_OUT\_R/L** – SCART2 Outputs (Fig. 4–19)

Output of the SCART2 signal. Connections to these pins must use a  $100-\Omega$  series resistor and are intended to be AC-coupled.

Pin 35, VREF1 - Reference Ground 1

Reference analog ground. This pin must be connected separately to the ground (AHVSS). VREF1 serves as a clean ground and should be used as the reference for analog connections to the SCART outputs.

Pins 36, 37, **SC1\_OUT\_R/L** – SCART1 Outputs (Fig. 4–19)

Output of the SCART1 signal. Connections to these pins must use a 100- $\Omega$  series resistor and are intended to be AC-coupled.

•

Pin 38, **CAPLA** – Volume Capacitor Aux (Fig. 4–14) A 10- $\mu$ F capacitor to AHVSUP must be connected to this pin. It serves as a smoothing filter for Aux volume changes in order to suppress audible plops. The value of the capacitor can be lowered to 1- $\mu$ F if faster response is required. The area encircled by the trace lines should be minimized; keep traces as short as possible. This input is sensitive for magnetic induction.

Pin 39, **AHVSUP\*** – Analog Power Supply High Voltage

Power is supplied via this pin for the analog circuitry of the MSP (except IF input). This pin must be connected to the +8 V supply. (+5 V-operation is possible with restrictions in performance)

Pin 40, **CAPLM** – Volume Capacitor Main (Fig. 4–14) A 10- $\mu$ F capacitor to AHVSUP must be connected to this pin. It serves as a smoothing filter for Main volume changes in order to suppress audible plops. The value of the capacitor can be lowered to 1  $\mu$ F if faster response is required. The area encircled by the trace lines should be minimized; keep traces as short as possible. This input is sensitive for magnetic induction.

Pins 41, 42, NC - Pins not connected.

Pins 43, 44, **AHVSS\*** – Analog Power Supply High Voltage

Ground connection for the analog circuitry of the MSP (except IF input).

Pin 45, **AGNDC** – Internal Analog Reference Voltage This pin serves as the internal ground connection for the analog circuitry (except IF input). It must be connected to the VREF pins with a 3.3- $\mu$ F and a 100-nF capacitor in parallel. This pins shows a DC level of typically 3.73 V.

Pin 46, NC - Pin not connected.

Pins 47, 48, **SC4\_IN\_L/R** – SCART4 Inputs (Fig. 4–16)

The analog input signal for SCART4 is fed to this pin. Analog input connection must be AC-coupled.

Pins 49, 52, and 55, **ASG\*** – Analog Shield Ground Analog ground (AHVSS) should be connected to this pin to reduce cross-coupling between SCART inputs.

Pins 50, 51, **SC3\_IN\_L/R** – SCART3 Inputs (Fig. 4–16)

The analog input signal for SCART3 is fed to this pin. Analog input connection must be AC-coupled.

Pins 53, 54 **SC2\_IN\_L/R** – SCART2 Inputs (Fig. 4–16) The analog input signal for SCART2 is fed to this pin. Analog input connection must be AC-coupled.

Pins 56, 57 **SC1\_IN\_L/R** – SCART1 Inputs (Fig. 4–16) The analog input signal for SCART1 is fed to this pin. Analog input connection must be AC-coupled.

Pin 58, **VREFTOP** – Reference Voltage IF A/D Converter (Fig. 4–13)

Via this pin, the reference voltage for the IF A/D converter is decoupled. It must be connected to AVSS pins with a 10- $\mu$ F and a 100-nF capacitor in parallel. Traces must be kept short.

Pin 59, NC - Pin not connected.

Pin 60 MONO\_IN - Mono Input (Fig. 4–16)

The analog mono input signal is fed to this pin. Analog input connection must be AC-coupled.

Pins 61, 62, **AVSS\*** – Analog Power Supply Voltage Ground connection for the analog IF input circuitry of the MSP.

Pins 63, 64, **NC** – Pins not connected.

Pins 65, 66, **AVSUP\*** – Analog Power Supply Voltage Power is supplied via this pin for the analog IF input circuitry of the MSP. This pin must be connected to the +5 V supply.

Pin 67, **ANA\_IN1**+ – IF Input 1 (Fig. 4–13)

The analog sound IF signal is supplied to this pin. Inputs must be AC-coupled. This pin is designed as symmetrical input: ANA\_IN1+ is internally connected to one input of a symmetrical op amp, ANA\_IN- to the other.

Pin 68, **ANA\_IN**— IF Common (Fig. 4–13) This pins serves as a common reference for ANA\_IN1/2+ inputs and must be AC-coupled.

Pin 69, **ANA\_IN2**+ – IF Input 2 (Fig. 4–13)

The analog sound if signal is supplied to this pin. Inputs must be AC-coupled. This pin is designed as symmetrical input: ANA\_IN2+ is internally connected to one input of a symmetrical op amp, ANA\_IN- to the other.

Pin 70, **TESTEN** – Test Enable Pin (Fig. 4–9) This pin enables factory test modes. For normal operation, it must be connected to ground.

# MSP 44x8G

Pins 71, 72 **XTAL\_IN, XTAL\_OUT** – Crystal Input and Output Pins (Fig. 4–12)

These pins are connected to an 18.432 MHz crystal oscillator which is digitally tuned by integrated capacitances. An external clock can be fed into XTAL\_IN (leave XTAL\_OUT vacant in this case). The audio clock output signal AUD\_CL\_OUT is derived from the oscillator. External capacitors at each crystal pin to ground (AVSS) are required. It should be verified by layout, that no supply current for the digital circuitry is flowing through the ground connection point.

Pin 73, **TP** – This pin enables factory test modes. For normal operation, it must be left vacant.

Pin 74, **AUD\_CL\_OUT** – Audio Clock Output (Fig. 4–12)

This is the 18.432 MHz main clock output.

Pins 75. 76. NC - Pins not connected.

Pins 77, 78, **D\_CTR\_I/O\_1/0** – Digital Control Input/ Output Pins (Fig. 4–11)

These pins serve as general purpose input/output pins. Pin D\_CTR\_I/O\_1 can be used as an interrupt request pin to the controller.

Pin 79, **ADR\_SEL** – I<sup>2</sup>C Bus Address Select (Fig. 4–10)

By means of this pin, one of three device addresses for the MSP can be selected. The pin can be connected to ground ( $^{12}$ C device addresses  $80/81_{hex}$ ), to +5 V supply ( $84/85_{hex}$ ), or left open ( $88/89_{hex}$ ).

#### Pin 80, STANDBYQ - Stand-by

In normal operation, this pin must be High. If the MSP is switched off by first pulling STANDBYQ low and then (after >1  $\mu$ s delay) switching off the 5 V, but keeping the 8-V power supply ('**Stand-by'-mode**), the SCART switches maintain their position and function.

Pin -, **I2S\_DA\_IN2/3** –I<sup>2</sup>S data input (see Fig. 4–9). This pin is connected to I2S\_DA\_IN2 and I2S\_DA\_IN3. Not available for PQFP80-pin package.

#### \* Application Note:

All ground pins should be connected to one low-resistive ground plane.

All supply pins should be connected separately with short and low-resistive lines to the power supply.

Decoupling capacitors from DVSUP to DVSS, AVSUP to AVSS, and AHVSUP to AHVSS are recommended as closely as possible to these pins. Decoupling of DVSUP and DVSS is most important. We recommend using more than one capacitor. By choosing different values, the frequency range of active decoupling can be extended. In our application boards we use: 220 pF, 470 pF, 1.5 nF, and 10  $\mu\text{F}$ . The capacitor with the lowest value should be placed nearest to the pins.

The ASG pins should be connected as closely as possible to the MSP ground. They are intended for leading with the SCART signals as shield lines and should <u>not</u> be connected to ground at the SCART-connector.

## 4.6.2.3. Recommendations for Analog Sound IF Input Signal

Symbol	Parameter	Pin Name	Min.	Тур.	Max.	Unit
C <sub>VREFTOP</sub>	VREFTOP-Filter-Capacitor	VREFTOP	-20 %	10		μF
	Ceramic Capacitor in Parallel		-20 %	100		nF
F <sub>IF_FMTV</sub>	Analog Input Frequency Range for TV Applications	ANA_IN1+, ANA_IN2+,	0		9	MHz
F <sub>IF_FMRADIO</sub>	Analog Input Frequency for FM-Radio Applications	ANA_IN-		10.7		MHz
V <sub>IF_FM</sub>	Analog Input Range FM/NICAM		0.1	0.8	3	V <sub>pp</sub>
V <sub>IF_AM</sub>	Analog Input Range AM/NICAM		0.1	0.45	0.8	V <sub>pp</sub>
R <sub>FMNI</sub>	Ratio: NICAM Carrier/FM Carrier (unmodulated carriers) BG: I:		-20 -23	-7 -10	0 0	dB dB
R <sub>AMNI</sub>	Ratio: NICAM Carrier/AM Carrier (unmodulated carriers)		-25	-11	0	dB
R <sub>FM</sub>	Ratio: FM-Main/FM-Sub Satellite			7		dB
R <sub>FM1/FM2</sub>	Ratio: FM1/FM2 German FM-System			7		dB
R <sub>FC</sub>	Ratio: Main FM Carrier/ Color Carrier		15	-	-	dB
R <sub>FV</sub>	Ratio: Main FM Carrier/ Luma Components		15	-	_	dB
PR <sub>IF</sub>	Passband Ripple		_	_	±2	dB
SUP <sub>HF</sub>	Suppression of Spectrum above 9.0 MHz (not for FM Radio)		15			dB
FM <sub>MAX</sub>	Maximum FM-Deviation (approx.) normal mode HDEV2: high deviation mode HDEV3: very high deviation mode				±180 ±360 ±540	kHz kHz kHz

#### 4.6.2.4. Crystal Recommendations

Symbol	Parameter	Pin Name	Min.	Тур.	Max.	Unit
General Cry	ystal Recommendations		•			
f <sub>P</sub>	Crystal Parallel Resonance Frequency at 12 pF Load Capacitance			18.432		MHz
R <sub>R</sub>	Crystal Series Resistance			8	25	Ω
C <sub>0</sub>	Crystal Shunt (Parallel) Capacitance			6.2	7.0	pF
C <sub>L</sub>	External Load Capacitance <sup>1)</sup>	XTAL_IN, XTAL_OUT	PSDIP P(L)QFI	approx. approx.		pF pF
Crystal Rec	commendations for Master-Slave Appli	cations (MSP-clock r	must perfor	m synchroi	nization to	<sup>2</sup> S clock)
f <sub>TOL</sub>	Accuracy of Adjustment		-20		+20	ppm
D <sub>TEM</sub>	Frequency Variation versus Temperature		-20		+20	ppm
C <sub>1</sub>	Motional (Dynamic) Capacitance		19	24		fF
f <sub>CL</sub>	Required Open Loop Clock Frequency (T <sub>amb</sub> = 25 °C)	AUD_CL_OUT	18.431		18.433	MHz
Crystal Rec	commendations for FM / NICAM Applic	ations (No MSP-clock	k synchroni	zation to I <sup>2</sup>	S clock po	ssible)
f <sub>TOL</sub>	Accuracy of Adjustment		-30		+30	ppm
$D_TEM$	Frequency Variation versus Temperature		-30		+30	ppm
C <sub>1</sub>	Motional (Dynamic) Capacitance		15			fF
f <sub>CL</sub>	Required Open Loop Clock Frequency (T <sub>amb</sub> = 25 °C)	AUD_CL_OUT	18.4305		18.4335	MHz
Crystal Rec	commendations for all analog FM/AM A	Applications (No MS	P-clock syn	chronizatio	n to I <sup>2</sup> S clo	ck possible)
f <sub>TOL</sub>	Accuracy of Adjustment		-100		+100	ppm
D <sub>TEM</sub>	Frequency Variation versus Temperature		-50		+50	ppm
f <sub>CL</sub>	Required Open Loop Clock Frequency (T <sub>amb</sub> = 25 °C)	AUD_CL_OUT	18.429		18.435	MHz
Amplitude	Recommendation for Operation with E	xternal Clock Input	: (C <sub>load</sub> aft	er reset ty	p. 22 pF)	
V <sub>XCA</sub>	External Clock Amplitude	XTAL_IN	0.7			$V_{pp}$

External capacitors at each crystal pin to ground are required. They are necessary to tune the open-loop frequency of the internal PLL and to stabilize the frequency in closed-loop operation.
Due to different layouts, the accurate capacitor size should be determined with the customer PCB. The suggested values (1.5...3.3 pF) are figures based on experience and should serve as "start value".

To define the capacitor size, reset the MSP without transmitting any further I2C telegrams. Measure the frequency at AUD\_CL\_OUT-pin. Change the capacitor size until the free running frequency matches 18.432 MHz as closely as possible. The higher the capacity, the lower the resulting clock frequency.

#### 4.6.3. Characteristics

at  $T_A$  = 0 to 70 °C,  $f_{CLOCK}$  = 18.432 MHz,  $V_{SUP1}$  = 7.6 to 8.7 V,  $V_{SUP2}$  = 4.75 to 5.25 V for min./max. values at  $T_A$  = 60 °C,  $f_{CLOCK}$  = 18.432 MHz,  $V_{SUP1}$  = 8 V,  $V_{SUP2}$  = 5 V for typical values,  $T_J$  = Junction Temperature Main (M) = Main Channel, Aux (A) = Aux Channel

#### 4.6.3.1. General Characteristics

Type of modulation / modulation depth				AM / 50%			
Modulation frequency	mono: unmodulated stereo: 117.5 Hz dual: 274.1 Hz			17.5 Hz	149.9 Hz 276.0 Hz		

#### 5.3. BTSC-Sound System

Table 5-4: Key parameters for BTSC-Sound Systems

	Aural Carrier	BTSC-MPX-Components				
		(L+R)	Pilot	(L–R)	SAP	Prof. Ch.
Carrier frequency (f <sub>h</sub> = 15.734 kHz)	4.5 MHz	Baseband	f <sub>h</sub>	2 f <sub>h</sub>	5 f <sub>h</sub>	6.5 f <sub>h</sub>
Sound bandwidth in kHz		0.05 - 15		0.05 - 15	0.05 - 12	0.05 - 3.4
Preemphasis		75 μs		DBX	DBX	150 μs
Max. deviation to Aural Carrier	73 kHz (total)	25 kHz <sup>1)</sup>	5 kHz	50 kHz <sup>1)</sup>	15 kHz	3 kHz
Max. Freq. Deviation of Subcarrier Modulation Type				AM	10 kHz FM	3 kHz FM
1) Sum does not exceed 50 kHz due to interleaving effects						

#### 5.4. Japanese FM Stereo System (EIA-J)

Table 5–5: Key parameters for Japanese FM-Stereo Sound System EIA-J

	Aural	EIA-J-MPX-Components			
	Carrier FM	(L+R)	(L-R)	Identification	
Carrier frequency (f <sub>h</sub> = 15.734 kHz)	4.5 MHz	Baseband	2 f <sub>h</sub>	3.5 f <sub>h</sub>	
Sound bandwidth		0.05 - 15 kHz	0.05 - 15 kHz	-	
Preemphasis	-	75 μs	75 μs	none	
Max. deviation portion to Aural Carrier	47 kHz	25 kHz	20 kHz	2 kHz	
Max. Freq. Deviation of Subcarrier Modulation Type			10 kHz FM	60% AM	
Transmitter-sided delay	=	20 μs	0 μs	0 μs	
Mono transmission	-	L+R	-	unmodulated	
Stereo transmission	1	L+R	L–R	982.5 Hz	
Bilingual transmission		Language A	Language B	922.5 Hz	

#### 5.5. FM Satellite Sound

Table 5–6: Key parameters for FM Satellite Sound

Carrier Frequency	Maximum FM Deviation	Sound Mode	Bandwidth	Deemphasis
6.5 MHz	85 kHz	Mono	15 kHz	50 μs
7.02/7.20 MHz	50 kHz	Mono/Stereo/Bilingual	15 kHz	adaptive
7.38/7.56 MHz	50 kHz	Mono/Stereo/Bilingual	15 kHz	adaptive
7.74/7.92 MHz	50 kHz	Mono/Stereo/Bilingual	15 kHz	adaptive

#### 5.6. FM-Stereo Radio

Table 5–7: Key parameters for FM-Stereo Radio Systems

	Aural Carrier	FM-Radio-MPX-Components			
	Carrier	(L+R)	Pilot	(L-R)	RDS/ARI
Carrier frequency (f <sub>p</sub> = 19 kHz)	10.7 MHz	Baseband	f <sub>p</sub>	2 f <sub>p</sub>	3 f <sub>p</sub>
Sound bandwidth in kHz		0.05 - 15		0.05 - 15	
Preemphasis:  – USA  – Europe		75 μs 50 μs		75 μs 50 μs	
Max. deviation to Aural Carrier	75 kHz (100%)	90%1)	10%	90%1)	5%
1) Sum does not exceed 90% due to interleaving effects					

## 6. Appendix B: Manual Mode

To adapt the modes of the STANDARD SELECT register to individual requirements, the MSP 44x8G offers a Manual Mode, which provides sophisticated programming of the MSP 44x8G.

The Manual Mode can be used only in those cases, where user specific requirements concerning detection, identification, or carrier positioning have to be met.

After the setting of the STANDARD SELECT register, the MSP 44x8G is set up for optimal behavior. **Therefore**, it is not recommended to use the Manual mode.

## 6.1. Demodulator Write and Read Registers for Manual Mode

In case of Automatic Sound Select (MODUS[0]=1), any modifications of all DCO registers listed in Table 6–1 are ignored.

**Table 6–1:** Demodulator Write Registers; Subaddress: 10<sub>hex</sub>; these registers are not readable!

# 6.3. Manual Mode: Description of Demodulator Write Registers

## 6.3.1. Automatic Switching between NICAM and Analog Sound

In case of bad NICAM reception or loss of the NICAM-carrier, the MSP 44x8G offers an Automatic Switching (fall back) to the analog sound (FM/AM-Mono), without the necessity of the controller reading and evaluating any parameters. If a proper NICAM signal returns, switching back to this source is performed automatically as well. The feature evaluates the NICAM ERROR\_RATE and switches, if necessary, all output channels which are assigned to the NICAM source, to the analog source, and vice versa.

An appropriate hysteresis algorithm avoids oscillating effects (see Fig. 6–1). STATUS[9] and C\_AD\_BITS[11] (Addr: 0023<sub>hex</sub>) provide information about the actual NICAM-FM/AM-status.

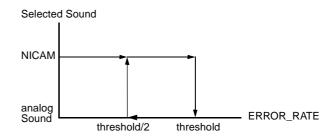

Fig. 6–1: Hysteresis for automatic switching

### 6.3.1.1. Function in Automatic Sound Select Mode

The Automatic Sound Select feature (MODUS[0]=1) includes the procedure mentioned above. By default, the internal ERROR\_RATE threshold is set to  $700_{dec}$ . i.e.:

- NICAM → analog sound if ERROR\_RATE > 700
- analog sound → NICAM if ERROR\_RATE < 700/2</li>

The ERROR\_RATE value of 700 corresponds to a BER of approximately 5.46\*10<sup>-3</sup>/s.

Individual configuration of the threshold can be done using Table 6–5, whereby the bits [0] and [11] of AUTO\_FM are ignored. It is recommended to use the internal setting used by the standard selection.

The optimum NICAM sound can be assigned to the MSP output channels by selecting one of the "Stereo or A/B", "Stereo or A", or "Stereo or B" source channels.

### 6.3.1.2. Function in Manual Mode

If the manual mode (MODUS[0]=0) is required, the activation and configuration of the Automatic Switching feature has to be done as described in Table 6–5. Note, that the channel matrix of the corresponding output channels must be set according to the NICAM mode and need not to be changed in the FM/AM-fallback case.

## Example:

Required threshold = 500: bits [10:1]=00 1111 1010

Table 6-5: Coding of Automatic NICAM/Analog Sound Switching;

Reset Status: Mode 0;

Automatic Sound Select is on (MODUS[0] = 1)

Mode	Description	AUTO_FM [11:0] Addr. = 00 21 <sub>hex</sub>	ERROR_RATE- Threshold/dec	Source Select: Input at NICAM Path <sup>1)</sup>
1	Automatic Switching with internal threshold (Default, if Automatic Sound Select is on)	Bit[11] = ignored Bit[10:1] = 0 Bit[0] = ignored	700	NICAM or FM/AM, depending on ERROR_RATE
2	Automatic Switching with external threshold (Customizing of Automatic Sound Select)	Bit[11] = ignored Bit[10:1] = 251000 = threshold/2 Bit[0] = ignored	set by customer; recommended range: 502000	

<sup>1)</sup> The NICAM path may be assigned to "Stereo or A/B", "Stereo or A", or "Stereo or B" source channels (see Table 2–2 on page 11).

Table 6-6: Coding of Automatic NICAM/Analog Sound Switching:

Reset Status: Mode 0;

Automatic Sound Select is off (MODUS[0] = 0)

Mode	Description	AUTO_FM [11:0] Addr. = 00 21 <sub>hex</sub>	ERROR_RATE- Threshold/dec	Source Select: Input at NICAM Path
0	Forced NICAM (Automatic Switching disabled)	Bit[11] = 0 Bit[10:1] = 0 Bit[0] = 0	none	always NICAM; Mute in case of no NICAM available
1	Automatic Switching with internal threshold (Default, if Automatic Sound Select is on)	Bit[11] = 0 Bit[10:1] = 0 Bit[0] = 1	700	NICAM or FM/AM, depending on ERROR_RATE
2	Automatic Switching with external threshold (Customizing of Automatic Sound Select)	Bit[11] = 0 Bit[10:1] = 251000 = threshold/2 Bit[0] = 1	set by customer; recommended range: 502000	
3	Forced Analog Mono (Automatic Switching disabled)	Bit[11] = 1 Bit[10:1] = 0 Bit[0] = 1	none	always FM/AM

## 6.3.2. A2 Threshold

The threshold between Stereo/Bilingual and Mono Identification for the A2 Standard has been made programmable according to the user's preferences.

An internal hysteresis ensures robustness and stability.

Table 6–7: Write Register on I<sup>2</sup>C Subaddress 10<sub>hex</sub>: A2 Threshold

THRESHOLDS								
00 22 <sub>hex</sub> (write)	00 22 <sub>hex</sub> (write) A2 THRESHOLD Register							
	Defines th							
	bit[11:0]	7F0 <sub>hex</sub>	force Mono Identification					
		 190 <sub>hex</sub>	default setting after reset					
		0A0 <sub>hex</sub>	minimum Threshold for stable detection					
	recomme	nded rang	e: 0A <sub>hex</sub> 3C <sub>hex</sub>					

## 6.3.3. Carrier-Mute Threshold

The Carrier-Mute threshold has been made programmable according to the users preferences. An internal hysteresis ensures stable behavior.

Table 6–8: Write Register on I<sup>2</sup>C Subaddress 10<sub>hex</sub>: Carrier-Mute Threshold

Register Address	Function	n		Name			
THRESHOLDS							
00 24 <sub>hex</sub> (write)	Carrier-I	Mute THRI	ESHOLD Register	CM_THRESH			
	Defines t	Defines threshold for the carrier mute feature					
	bit[6:0]	bit[6:0] 00 <sub>hex</sub> Carrier-Mute always ON (both channels muted)					
		2A <sub>hex</sub>	default setting after reset				
		FF <sub>hex</sub>	Carrier-Mute always OFF (both channels forced on)				
	recomme	ended rang	e: 14 <sub>hex</sub> 50 <sub>hex</sub>				

### 6.3.4. DCO-Registers

**Note:** The use of this register is not recommended. It should be used only in cases where non-standard carrier frequencies have to be processed. Please note, that the usage of user specific demodulation frequencies is not possible in combination with the Automatic Sound Select (MODUS[0]=1).

When selecting a TV-sound standard by means of the STANDARD SELECT register, all frequency tuning is performed automatically.

If manual setting of the tuning frequency is required, a set of 24-bit registers determining the mixing frequencies of the quadrature mixers can be written manually into the MSP. In Table 6–9, examples for DCO register programming are listed. It is necessary to separate these registers into two categories: low part and high part. The formula for the calculation of the INCR values for any chosen IF frequency is as follows:

 $INCR_{dec} = int (f / fs \cdot 2^{24})$ 

with: int = integer function

f = IF frequency in MHz

 $f_S$  = sampling frequency (18.432 MHz)

Conversion of INCR into hex-format and separation of the 12-bit low and high parts lead to the required register values (DCO1\_HI and \_LO for MSP-Ch1, DCO2\_HI and \_LO for MSP-Ch2).

## 6.4. Manual Mode: Description of Demodulator Read Registers

**Note:** This register should be used only in cases where software compatibility to the MSP 44x0D is required. Using the STANDARD SELECTION register together with the STATUS register provides a more economic way to program the MSP 44x8G and to retrieve information from the MSP.

All registers except C\_AD\_BITs are 8 bits wide. They can be read out of the RAM of the MSP 44x8G.

All transmissions take place in 16-bit words. The valid 8-bit data are the 8 LSBs of the received data word.

If the Automatic Sound Select feature is not used, the NICAM or FM-identification parameters must be read and evaluated by the controller in order to enable appropriate switching of the channel select matrix of the baseband processing part. The FM-identification registers are described in Section 6.6.1. To handle the NICAM-sound and to observe the NICAM-quality, at least the registers C\_AD\_BITS and ERROR\_RATE must be read and evaluated by the controller. Additional data bits and CIB bits, if supplied by the NICAM transmitter, can be obtained by reading the registers ADD\_BITS and CIB\_BITS.

Table 6-9: DCO registers for the MSP 44x8G; reset status: DCO\_HI/LO = "00 00"

	DCO1_LO 00 93 <sub>hex</sub> , DCO1_HI 00 9B <sub>hex</sub> ; DCO2_LO 00 A3 <sub>hex</sub> , DCO2_HI 00 AB <sub>hex</sub>										
IF-Freq. [MHz]	DCO_HI [hex]	DCO_LO [hex]	IF-Freq. [MHz]	DCO_HI [hex]	DCO_LO [hex]						
4.5	03 E8	00 00									
5.04 5.5 5.58 5.7421875	04 60 04 C6 04 D8 04 FC	00 00 03 8E 00 00 00 AA	5.76 5.85 5.94	05 00 05 14 05 28	00 00 00 00 00 00

7.02	06 18	00 00	7.2	06 40	00 00						
7.38	06 68	00 00	7.56	06 90	00 00						

## 6.4.1. NICAM Mode Control/Additional Data Bits Register

NICAM operation mode control bits and A[2:0] of the additional data bits.

#### Format:

MSE	MSB C_AD_BITS 00 23 <sub>hex</sub> LS									
11		7	6	5	4	3	2	1	0	
Auto _FM		A[2]	A[1]	A[0]	C4	C3	C2	C1	S	

**Important:** "S" = Bit[0] indicates correct NICAM-synchronization (S = 1). If S = 0, the MSP 4418/4458G has not yet synchronized correctly to frame and sequence, or has lost synchronization. The remaining read registers are therefore not valid. The MSP mutes the NICAM output automatically and tries to synchronize again as long as any NICAM standard is selected by the STANDARD SELECT register.

The operation mode is coded by C4-C1 as shown in Table 6–10.

**Table 6–10:** NICAM operation modes as defined by the EBU NICAM 728 specification

C4	СЗ	C2	C1	Operation Mode	
0	0	0	0	Stereo sound (NICAMA/B), independent mono sound (FM1)	
0	0	0	1	Two independent mono signals (NICAMA, FM1)	
0	0	1	0	Three independent mono channels (NICAMA, NICAMB, FM1)	
0	0	1	1	Data transmission only; no audio	
1	0	0	0	Stereo sound (NICAMA/B), FM1 carries same channel	
1	0	0	1	One mono signal (NICAMA). FM1 carries same channel as NICAMA	
1	0	1	0	Two independent mono channels (NICAMA, NICAMB). FM1 carries same channel as NICAMA	
1	0	1	1	Data transmission only; no audio	
х	1	х	Х	Unimplemented sound coding option (not yet defined by EBU NICAM 728 specification)	

AUTO\_FM: monitor bit for the AUTO\_FM Status:

**Note:** It is not necessary to read out and evaluate the C\_AD\_BITS. All evaluation is performed in the MSP and indicated in the STATUS register.

## 6.4.2. Additional Data Bits Register

Contains the remaining 8 of the 11 additional data bits. The additional data bits are not yet defined by the NICAM 728 system.

#### Format:

MSB	B ADD_BITS 00 38 <sub>hex</sub> L								
7	6	5	4	3	2	1	0		
A[10]	A[9]	A[8]	A[7]	A[6]	A[5]	A[4]	A[3]		

## 6.4.3. CIB Bits Register

CIB bits 1 and 2 (see NICAM 728 specifications).

#### Format:

MSB	MSB CIB_BITS 00 3E <sub>hex</sub> LSE						LSB
7	6	5	4	3	2	1	0
х	х	х	х	х	х	CIB1	CIB2

## 6.4.4. NICAM Error Rate Register

ERROR_RATE	00 57 <sub>hex</sub>
Error free	0000 <sub>hex</sub>
maximum error rate	07FF <sub>hex</sub>

Average error rate of the NICAM reception in a time interval of 182 ms, which should be close to 0. The initial and maximum value of ERROR\_RATE is 2047. This value is also active if no NICAM-standard is selected. Since the value is achieved by filtering, a certain transition time (approx. 0.5 sec) is unavoidable. Acceptable audio may have error rates up to a value of  $700_{\rm dec}$ . Individual evaluation of this value by the controller and an appropriate threshold may define the fall-back mode from NICAM to FM/AM-Mono in case of poor NICAM reception.

The bit error rate per second (BER) can be calculated by means of the following formula:

BER = ERROR RATE \*  $12.3*10^{-6}$  /s

<sup>0:</sup> NICAM source is NICAM

<sup>1:</sup> NICAM source is FM

## 6.5. Manual Mode: Description of DSP Write Registers

### 6.5.1. Additional Channel Matrix Modes

Main Matrix	00 08 <sub>hex</sub>	L
Aux Matrix	00 09 <sub>hex</sub>	L
SCART1 Matrix	00 0A <sub>hex</sub>	L
SCART2 Matrix	00 41 <sub>hex</sub>	L
I <sup>2</sup> S Matrix	00 0B <sub>hex</sub>	L
Quasi-Peak Detector Matrix	00 0C <sub>hex</sub>	L
SUM/DIFF	0100 0000	40 <sub>hex</sub>
AB_XCHANGE	0101 0000	50 <sub>hex</sub>
PHASE_CHANGE_B	0110 0000	60 <sub>hex</sub>
PHASE_CHANGE_A	0111 0000	70 <sub>hex</sub>
A_ONLY	1000 0000	80 <sub>hex</sub>
B_ONLY	1001 0000	90 <sub>hex</sub>

This table shows additional modes for the channel matrix registers.

The sum/difference mode can be used together with the quasi-peak detector to determine the sound material mode. If the difference signal on channel B (right) is near to zero, and the sum signal on channel A (left) is high, the incoming audio signal is mono. If there is a significant level on the difference signal, the incoming audio is stereo.

## 6.5.2. FM Fixed Deemphasis

FM Deemphasis	00 0F <sub>hex</sub>	Н
50 μs	0000 0000 RESET	00 <sub>hex</sub>
75 μs	0000 0001	01 <sub>hex</sub>
OFF	0011 1111	3F <sub>hex</sub>

## 6.5.3. FM Adaptive Deemphasis

FM Adaptive Deemphasis WP1	00 0F <sub>hex</sub>	L
OFF	0000 0000 RESET	00 <sub>hex</sub>
WP1	0011 1111	3F <sub>hex</sub>

Note: The Adaptive Deemphasis WP1 requires setting of fixed deemphasis to  $75\mu s$ .

## 6.5.4. NICAM Deemphasis

A J17 Deemphasis is always applied to the NICAM signal. It is not switchable.

## 6.5.5. Identification Mode for A2 Stereo Systems

Identification Mode	00 15 <sub>hex</sub>	L
Standard B/G (German Stereo)	0000 0000 RESET	00 <sub>hex</sub>
Standard M (Korean Stereo)	0000 0001	01 <sub>hex</sub>
Reset of Ident-Filter	0011 1111	3F <sub>hex</sub>

To shorten the response time of the identification algorithm after a program change between two FM-Stereo capable programs, the reset of the ident-filter can be applied.

## Sequence:

- 1. Program change
- 2. Reset ident-filter
- 3. Set identification mode back to standard B/G or M
- 4. Read stereo detection register

## 6.6. Manual Mode: Description of DSP Read Registers

All readable registers are 16-bit wide. Transmissions via I<sup>2</sup>C bus have to take place in 16-bit words. Some of the defined 16-bit words are divided into low and high byte, thus holding two different control entities.

These registers are not writable.

## 6.6.1. Stereo Detection Register for A2 Stereo Systems

Stereo Detection Register	00 18 <sub>hex</sub> H
Stereo Mode	Reading (two's complement)
MONO	near zero
STEREO	positive value (ideal reception: 7F <sub>hex</sub> )
BILINGUAL	negative value (ideal reception: 80 <sub>hex)</sub>

**Note:** It is not necessary to read out and evaluate the A2 identification level. All evaluation is performed in the MSP and indicated in the STATUS register.

## 6.6.2. DC Level Register

DC Level Readout FM1 (MSP-Ch2)	00 1B <sub>hex</sub> H+L	-
DC Level Readout FM2 (MSP-Ch1)	00 1C <sub>hex</sub> H+L	-
DC Level	[8000 <sub>hex</sub> 7FFF <sub>hex</sub> ] values are 16 bit two's complement	

The DC level register measures the DC component of the incoming FM signals (FM1 and FM2). This can be used for seek functions in satellite receivers and for IF FM frequencies fine tuning. If the DCO frequency is lower than the actuel carrier frequency, the resulting DC level will be positive, an dvia versa. In the audio signal the DC content is suppressed. The time constant  $\tau$ , defining the transition time of the DC Level Register, is approximately 28 ms.

### 6.7. Demodulator Source Channels in Manual Mode

### 6.7.1. Terrestrial Sound Standards

Table 6–11 shows the source channel assignment of the demodulated signals in case of manual mode for all terrestrial sound standards. See Table 2–2 for the assignment in the Automatic Sound Select mode. In manual mode for terrestrial sound standards, only two demodulator sources are defined.

### 6.7.2. SAT Sound Standards

Table 6–12 shows the source channel assignment of the demodulated signals for SAT sound standards.

Table 6–11: Manual Sound Select Mode for Terrestrial Sound Standards

				Source Channels of	Sound Select Block	
Broadcasted Selected MSP Standard Code		Broadcasted FM Matrix Sound Mode		FM/AM (use 0 for channel select)	Stereo or A/B (use 1 for channel select)	
B/G-FM	03	MONO	Sound A Mono	Mono	Mono	
D/K-FM M-Korea M-Japan	04, 05 02 30	STEREO	German Stereo Korean Stereo	Stereo	Stereo	
		BILINGUAL, Languages A and B	No Matrix	Left = A Right = B	Left = A Right = B	
B/G-NICAM L-NICAM I-NICAM D/K-NICAM	08 09 0A 0B	NICAM not available or NICAM error rate too high	Sound A Mono	analog Mono	no sound with AUTO_FM: analog Mono	
D/K-NICAM (with high	D/K-NICAM 0C (with high deviation FM)	MONO	Sound A Mono	analog Mono	NICAM Mono	
deviation FM)		STEREO	Sound A Mono	analog Mono	NICAM Stereo	
		BILINGUAL, Languages A and B	Sound A Mono	analog Mono	Left = NICAM A Right = NICAM B	
		MONO	Sound A Mono	Mono	Mono	
	20	STEREO	Korean Stereo	Stereo	Stereo	
		MONO + SAP	Sound A Mono	Mono	Mono	
BTSC		STEREO + SAP	Korean Stereo	Stereo	Stereo	
БТОО		MONO	Sound A Mono	Mono	Mono	
	21	STEREO	Souria A Morio	Widilo	IVIOTIO	
		MONO + SAP	No Matrix	Left = Mono	Left = Mono	
		STEREO + SAP	140 Matrix	Right = SAP	Right = SAP	
FM-Radio	40	MONO	Sound A Mono	Mono	Mono	
i W-itaulo	40	STEREO	Korean Stereo	Stereo	Stereo	

Table 6–12: Manual Sound Select Modes for SAT-reception (FM Matrix is set automatically)

			Source Channels of Sound Select Block for SAT-Modes				
Broadcasted Sound Standard	Selected MSP Standard Code	Broadcasted Sound Mode	FM/AM (source select: 0)	Stereo or A/B (source select: 1)	Stereo or A (source select: 3)	Stereo or B (source select: 4)	
	6, 50 <sub>hex</sub>	MONO	Mono	Mono	Mono	Mono	
FM SAT	51 <sub>hex</sub>	STEREO	Stereo	Stereo	Stereo	Stereo	
		BILINGUAL	Left = A (FM1) Right = B (FM2)	Left = A (FM1) Right = B (FM2)	A (FM1)	B (FM2)	

## 7. Appendix C: Application Information

## 7.1. Exclusions of Audio Baseband Features

In general, all functions can be switched independently. Two exceptions exist:

- 1. NICAM cannot be processed simultaneously with secondary channel (see Fig. 2–3 and Fig. 2–2 on page 10).
- 2. FM adaptive deemphasis cannot be processed simultaneously with FM-identification.

## 7.2. Phase Relationship of Analog Outputs

The analog output signals: Main, Aux, and SCART2 all have the same phases. The SCART1 output has opposite phase.

Using the I<sup>2</sup>S-outputs for other DSPs or D/A converters, care must be taken to adjust for the correct phase.

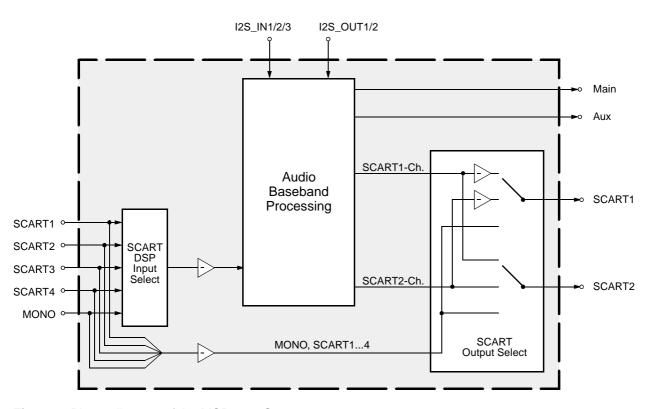

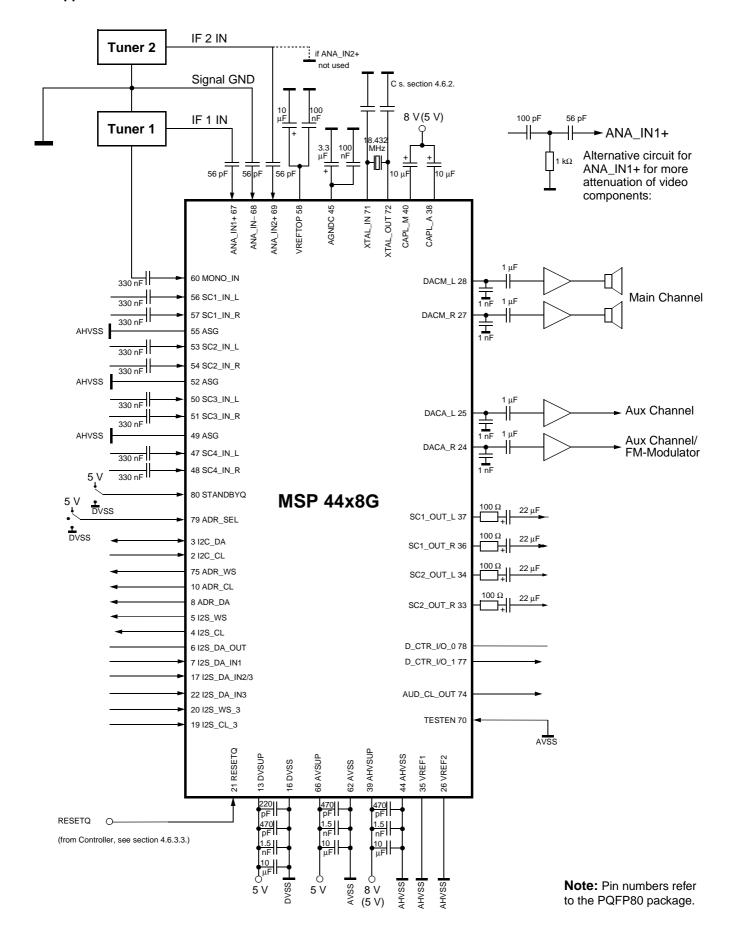

Fig. 7-1: Phase diagram of the MSP 44x8G

## 7.3. Application Circuit

## MSP 44x8G

## 8. Data Sheet History
