

# SYNCHRONOUS DRAM MODULE

MT8LSDT864A, MT16LSDT1664A

For the latest data sheet revisions, please refer to the Micron Web site: [www.micron.com/mti/msp/html/datasheet.html](http://www.micron.com/mti/msp/html/datasheet.html)

## FEATURES

- PC100-compliant; includes CONCURRENT AUTO PRECHARGE
- JEDEC-standard 168-pin, dual in-line memory module (DIMM)
- Utilizes 100 MHz and 125 MHz SDRAM components
- Nonbuffered
- 64MB (8 Meg x 64) and 128MB (16 Meg x 64)
- Single +3.3V ±0.3V power supply
- Fully synchronous; all signals registered on positive edge of system clock
- Internal pipelined operation; column address can be changed every clock cycle
- Internal SDRAM banks for hiding row access/precharge
- Programmable burst lengths: 1, 2, 4, 8 or full page
- Auto Precharge and Auto Refresh Modes
- Self Refresh Mode
- 64ms, 4,096-cycle refresh
- LVTTL-compatible inputs and outputs
- Serial presence-detect (SPD)
- Two-clock WRITE recovery (<sup>t</sup>WR) version; one-clock (<sup>t</sup>WR) not supported.

## OPTIONS

- Package  
168-pin DIMM (gold)
- Frequency/CAS Latency  
100 MHz/CL = 3 (8ns, 125 MHz SDRAMs) -10C  
100 MHz/CL = 3 (8ns, 125 MHz SDRAMs) -10B  
66 MHz/CL = 2 (10ns, 100 MHz SDRAMs) -662

## PART NUMBERS

PART NUMBER	CONFIGURATION	SYSTEM BUS SPEED
MT8LSDT864AG-662__	8 Meg x 64	66 MHz
MT8LSDT864AG-10B__	8 Meg x 64	100 MHz
MT8LSDT864AG-10C__	8 Meg x 64	100 MHz
MT16LSDT1664AG-662__	16 Meg x 64	66 MHz
MT16LSDT1664AG-10B__	16 Meg x 64	100 MHz
MT16LSDT1664AG-10C__	16 Meg x 64	100 MHz

**NOTE:** All part numbers end with a two-place code (not shown), designating component and PCB revisions. Consult factory for current revision codes. Example: MT8LSDT864AG-10BD2.

## GENERAL DESCRIPTION

The MT8LSDT864A and MT16LSDT1664A are high-speed CMOS, dynamic random-access, 64MB and 128MB memories organized in a x64 configuration. These modules use internally configured quad-bank SDRAMs with a synchronous interface (all signals are registered on the positive edge of the clock signals CK0-CK3).

Read and write accesses to the SDRAM module are burst oriented; accesses start at a selected location and continue for a programmed number of locations in a programmed sequence. Accesses begin with the registration of an ACTIVE command, which is then followed by a READ or WRITE command. The address bits registered coincident with the ACTIVE command are used to select the bank and row to be accessed (BA0, BA1 select the bank, A0-A11 select the row). The address bits registered coincident with the READ or WRITE command are used to select the starting column location for the burst access.

The modules provide for programmable READ or WRITE burst lengths of 1, 2, 4 or 8 locations, or the full page, with a burst terminate option. An AUTO PRECHARGE function may be enabled to provide a self-timed row precharge that is initiated at the end of the burst sequence.

The modules use an internal pipelined architecture to achieve high-speed operation. This architecture is compatible with the  $2n$  rule of prefetch architectures, but it also allows the column address to be changed on every clock cycle to achieve a high-speed, fully random access. Precharging one bank while accessing one of the other three banks will hide the precharge cycles and provide seamless, high-speed, random-access operation.

The modules are designed to operate in 3.3V, low-power memory systems. An auto refresh mode is provided, along with a power-saving, power-down mode. All inputs and outputs are LVTTTL-compatible.

SDRAM modules offer substantial advances in DRAM operating performance, including the ability to synchronously burst data at a high data rate with automatic column-address generation, the ability to interleave between internal banks in order to hide precharge time and the capability to randomly change column addresses on each clock cycle during a burst access. For more information regarding the SDRAM operation, refer to the 64Mb: x4, x8, x16 SDRAM data sheet.

## SERIAL PRESENCE-DETECT OPERATION

This module incorporates serial presence-detect (SPD). The SPD function is implemented using a 2,048-bit EEPROM. This nonvolatile storage device contains 256 bytes. The first 128 bytes can be programmed by Micron to identify the module type and various SDRAM organizations and timing parameters. The remaining 128 bytes of storage are available for use by the customer. System READ/WRITE operations between the master (system logic) and the slave EEPROM device (DIMM) occur via a standard IIC bus using the DIMM's SCL (clock) and SDA (data) signals, together with SA(2:0), which provide eight unique DIMM/EEPROM addresses.

**SPD CLOCK AND DATA CONVENTIONS**

Data states on the SDA line can change only during SCL LOW. SDA state changes during SCL HIGH are reserved for indicating start and stop conditions (Figures 1 and 2).

**SPD START CONDITION**

All commands are preceded by the start condition, which is a HIGH-to-LOW transition of SDA when SCL is HIGH. The SPD device continuously monitors the SDA and SCL lines for the start condition and will not respond to any command until this condition has been met.

**SPD STOP CONDITION**

All communications are terminated by a stop condition, which is a LOW-to-HIGH transition of SDA when SCL is HIGH. The stop condition is also used to place the SPD device into standby power mode.

**Figure 1  
DATA VALIDITY**

**SPD ACKNOWLEDGE**

Acknowledge is a software convention used to indicate successful data transfers. The transmitting device, either master or slave, will release the bus after transmitting eight bits. During the ninth clock cycle, the receiver will pull the SDA line LOW to acknowledge that it received the eight bits of data (Figure 3).

The SPD device will always respond with an acknowledge after recognition of a start condition and its slave address. If both the device and a WRITE operation have been selected, the SPD device will respond with an acknowledge after the receipt of each subsequent eight bit word. In the read mode the SPD device will transmit eight bits of data, release the SDA line and monitor the line for an acknowledge. If an acknowledge is detected and no stop condition is generated by the master, the slave will continue to transmit data. If an acknowledge is not detected, the slave will terminate further data transmissions and await the stop condition to return to standby power mode.

**PIN DESCRIPTIONS**

PIN NUMBERS	SYMBOL	TYPE	DESCRIPTION
115, 111, 27	RAS#, CAS#, WE#	Input	Command Inputs: RAS#, CAS# and WE# (along with S0#-S3#) define the command being entered.
42, 79, 125, 163	CK0-CK3	Input	Clock: CK0-CK3 are driven by the system clock. All SDRAM input signals are sampled on the positive edge of CK. CK also increments the internal burst counter and controls the output registers.
63, 128	CKE1, CKE0	Input	Clock Enable: CKE0-CKE1 activate (HIGH) and deactivate (LOW) the CK0-CK3 signals. Deactivating the clock provides PRECHARGE POWER-DOWN and SELF REFRESH operation (all banks idle), ACTIVE POWER-DOWN (row ACTIVE in any bank) or CLOCK SUSPEND operation (burst access in progress). CKE0-CKE1 are synchronous except after the device enters power-down and self refresh modes, where CKE0-CKE1 become asynchronous until after exiting the same mode. The input buffers, including CK0-CK3, are disabled during power-down and self refresh modes, providing low standby power.
30, 45, 114, 129	S0#-S3#	Input	Chip Select: S0#-S3# enable (registered LOW) and disable (registered HIGH) the command decoder. All commands are masked when S0#-S3# are registered HIGH. S0#-S3# are considered part of the command code.
28-29, 46-47, 112-113, 130-131	DQMB0-DQMB7	Input	Input/Output Mask: DQMB is an input mask signal for write accesses and an output enable signal for read accesses. Input data is masked when DQMB is sampled HIGH during a WRITE cycle. The output buffers are placed in a High-Z state (two-clock latency) when DQMB is sampled HIGH during a READ cycle.
39, 122	BA1, BA0	Input	Bank Address: BA0 and BA1 define to which bank the ACTIVE, READ, WRITE or PRECHARGE command is being applied.
33-38, 117-121, 123	A0-A11	Input	Address Inputs: A0-A11 are sampled during the ACTIVE command (row-address A0-A11) and READ/WRITE command (column-address A0-A8, with A10 defining AUTO PRECHARGE) to select one location out of the memory array in the respective bank. A10 is sampled during a PRECHARGE command to determine if all banks are to be precharged (A10 HIGH) or bank selected by BA0, BA1 (LOW). The address inputs also provide the op-code during a LOAD MODE REGISTER command.
2-5, 7-11, 13-17, 19-20, 55-58, 60, 65-67, 69-72, 74-77, 86-89, 91-95, 97-101, 103-104, 139-142, 144, 149-151, 153-156, 158-161	DQ0-DQ63	Input/Output	Data I/O: Data bus.

**PIN DESCRIPTIONS (continued)**

PIN NUMBERS	SYMBOL	TYPE	DESCRIPTION
6, 18, 26, 40, 41, 49, 59, 73, 84, 90, 102, 110, 124, 133, 143, 157, 168	V <sub>DD</sub>	Supply	Power Supply: +3.3V ±0.3V.
1, 12, 23, 32, 43, 54, 64, 68, 78, 85, 96, 107, 116, 127, 138, 148, 152, 162	V <sub>SS</sub>	Supply	Ground.
81	WP	Input	Write Protect: Serial presence-detect hardware write protect. Applies to -10B/-10C versions only.
82	SDA	Input/Output	Serial Presence-Detect Data: SDA is a bidirectional pin used to transfer addresses and data into and data out of the presence-detect portion of the module.
83	SCL	Input	Serial Clock for Presence-Detect: SCL is used to synchronize the presence-detect data transfer to and from the module.
165-167	SA0-SA2	Input	Presence-Detect Address Inputs: These pins are used to configure the presence-detect device.
126, 132	RFU	–	Reserved for Future Use: These pins should be left unconnected.
31, 44, 48	DNU	–	Do Not Use: These pins are not connected on these modules but are assigned pins on the compatible DRAM version.

## COMMANDS

Truth Table 1 provides a general reference of available commands. For a more detailed description of commands

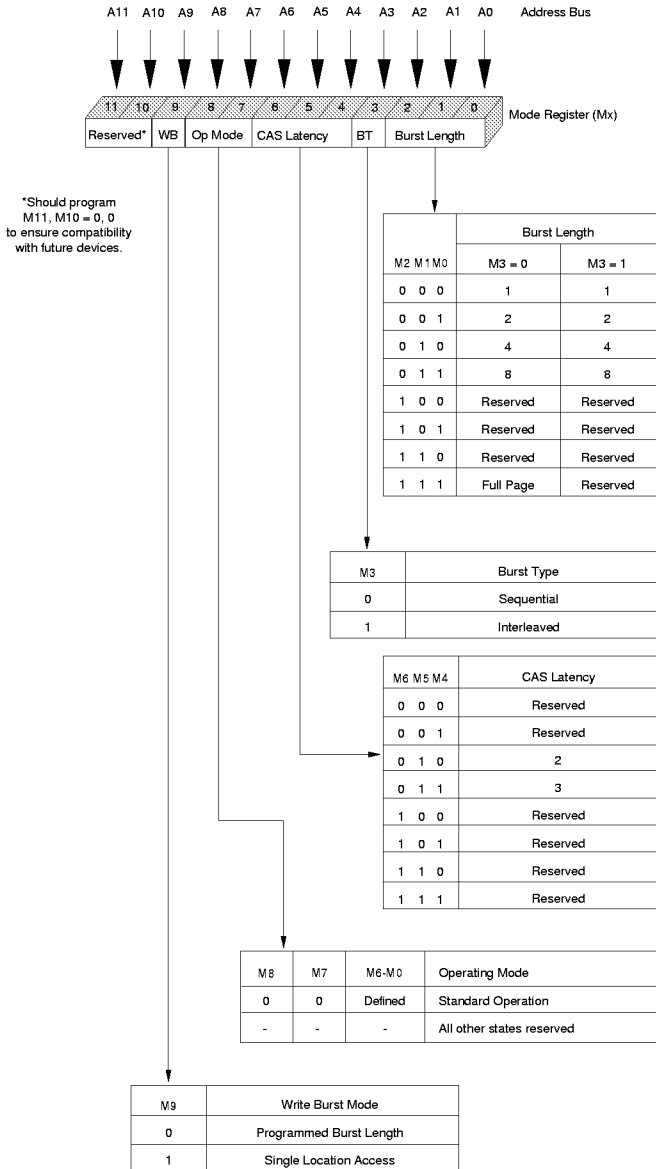

and operations, refer to the 64Mb: x4, x8, x16 SDRAM data sheet.

### TRUTH TABLE 1 – Commands and DQMB Operation

(Notes: 1)

NAME (FUNCTION)	CS#	RAS#	CAS#	WE#	DQMB	ADDR	DQs	NOTES
COMMAND INHIBIT (NOP)	H	X	X	X	X	X	X	
NO OPERATION (NOP)	L	H	H	H	X	X	X	
ACTIVE (Select bank and activate row)	L	L	H	H	X	Bank/Row	X	3
READ (Select bank and column, and start READ burst)	L	H	L	H	X	Bank/Col	X	4
WRITE (Select bank and column, and start WRITE burst)	L	H	L	L	X	Bank/Col	Valid	4
BURST TERMINATE	L	H	H	L	X	X	Active	
PRECHARGE (Deactivate row in bank or banks)	L	L	H	L	X	Code	X	5
AUTO REFRESH or SELF REFRESH (Enter self refresh mode)	L	L	L	H	X	X	X	6, 7
LOAD MODE REGISTER	L	L	L	L	X	Op-code	X	2
Write Enable/Output Enable	–	–	–	–	L	–	Active	8
Write Inhibit/Output High-Z	–	–	–	–	H	–	High-Z	8

- NOTE:**
1. CKE is HIGH for all commands shown except SELF REFRESH.
  2. A0-A11 define the op-code written to the Mode Register.
  3. A0-A11 provide row address, and BA0, BA1 determine which bank is made active.
  4. A0-A8 provide column address; A10 HIGH enables the auto precharge feature (nonpersistent), while A10 LOW disables the auto precharge feature; BA0, BA1 determine which bank is being read from or written to.
  5. A10 LOW: BA0, BA1 determine which bank is being precharged. A10 HIGH: all banks are precharged and BA0, BA1 are "Don't Care."
  6. This command is AUTO REFRESH if CKE is HIGH, SELF REFRESH if CKE is LOW.
  7. Internal refresh counter controls row addressing; all inputs and I/Os are "Don't Care" except for CKE.
  8. Activates or deactivates the DQs during WRITES (zero-clock delay) and READs (two-clock delay).

**Figure 1  
MODE REGISTER DEFINITION**

Full Page (y)	n = A0-A8 (location 0-y)	Cn, Cn + 1, Cn + 2 Cn + 3, Cn + 4... ...Cn - 1, Cn...	Not supported

- NOTE:**
1. For full-page accesses: y = 512.
  2. For a burst length of two, A1-A8 select the block-of-two burst; A0 selects the starting column within the block.
  3. For a burst length of four, A2-A8 select the block-of-four burst; A0-A1 select the starting column within the block.
  4. For a burst length of eight, A3-A8 select the block-of-eight burst; A0-A2 select the starting column within the block.
  5. For a full-page burst, the full row is selected, and A0-A8 select the starting column.
  6. Whenever a boundary of the block is reached within a given sequence above, the following access wraps within the block.
  7. For a burst length of one, A0-A8 select the unique column to be accessed, and Mode Register bit M3 is ignored.

**ABSOLUTE MAXIMUM RATINGS\***

Voltage on V<sub>DD</sub> Supply Relative to V<sub>SS</sub> ..... -1V to +4.6V  
 Voltage on Inputs, NC or I/O Pins  
     Relative to V<sub>SS</sub> ..... -1V to +4.6V  
 Operating Temperature, T<sub>A</sub> (ambient) ..... 0°C to +70°C  
 Storage Temperature (plastic) ..... -55°C to +125°C  
 Power Dissipation ..... 8W

\*Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

## NOTES

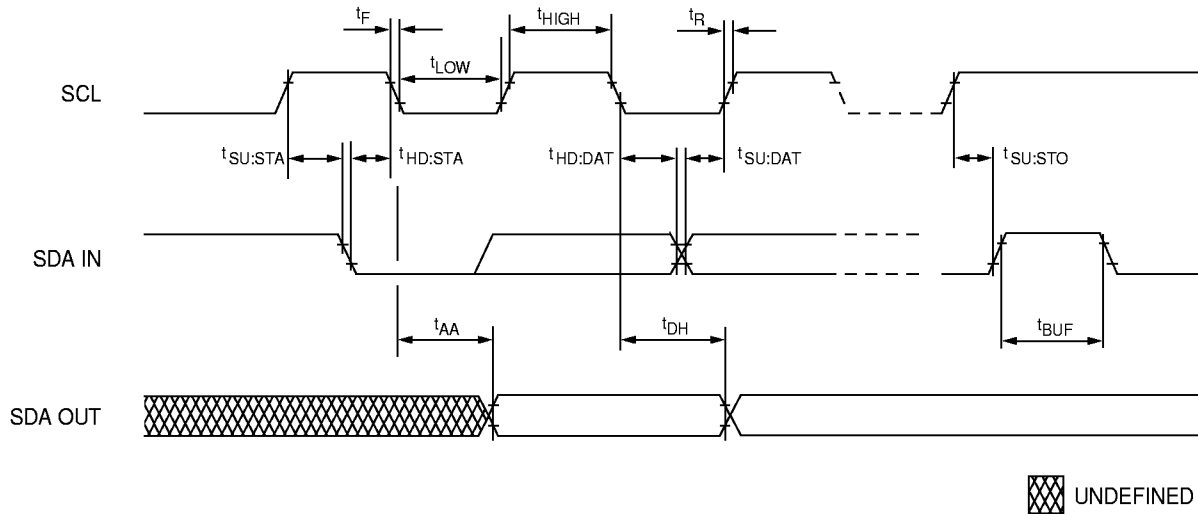

1. All voltages referenced to  $V_{SS}$ .
2. This parameter is sampled.  $V_{DD} = +3.3V$ ;  $f = 1\text{MHz}$ .
3.  $I_{CC}$  is dependent on output loading and cycle rates. Specified values are obtained with minimum cycle time and the outputs open.
4. Enables on-chip refresh and address counters.
5. The minimum specifications are used only to indicate cycle time at which proper operation over the full temperature range ( $0^{\circ}\text{C} \leq T_A \leq 70^{\circ}\text{C}$ ) is ensured.
6. An initial pause of  $100\mu\text{s}$  is required after power-up, followed by two AUTO REFRESH commands, before proper device operation is ensured. The two AUTO REFRESH command wake-ups should be repeated any time the  $t_{REF}$  refresh requirement is exceeded.
7. AC characteristics assume  $t_T = 1\text{ns}$ .
8. In addition to meeting the transition rate specification, the clock and CKE must transit between  $V_{IH}$  and  $V_{IL}$  (or between  $V_{IL}$  and  $V_{IH}$ ) in a monotonic manner.
9. Outputs measured at  $1.5V$  with equivalent load:

10.  $t_{HZ}$  defines the time at which the output achieves the open circuit condition; it is not a reference to  $V_{OH}$  or  $V_{OL}$ . The last valid data element will meet  $t_{OH}$  before going High-Z.
11. AC timing and  $I_{CC}$  tests have  $V_{IL} = 0V$  and  $V_{IH} = 3V$ , with timing referenced to  $1.5V$  crossover point.
12. Other input signals are allowed to transition no more than once in any  $30\text{ns}$  period ( $20\text{ns}$  on -10B) and are otherwise at valid  $V_{IH}$  or  $V_{IL}$  levels.
13.  $I_{CC}$  specifications are tested after the device is properly initialized.
14. Timing actually specified by  $t_{CKS}$ ; clock(s) specified as a reference only at minimum cycle rate.
15. Timing actually specified by  $t_{WR}$  plus  $t_{RP}$ ; clock(s) specified as a reference only at minimum cycle rate.

16. Timing actually specified by  $t_{WR}$ .
17. Required clocks are specified by JEDEC functionality and are not dependent on any timing parameter.
18. The  $I_{CC}$  current will decrease as the CAS latency is reduced. This is due to the fact that the maximum cycle rate is slower as the CAS latency is reduced.
19. Address transitions average one transition every  $30\text{ns}$  ( $20\text{ns}$  on -10B/-10C).
20. CLK must be toggled a minimum of two times during this period.
21. Based on  $t_{CK} = 100\text{MHz}$  for -10B/-10C and  $66\text{MHz}$  for -662.
22.  $64\text{MB}$  module values will be half of those shown.
23. The SPD EEPROM WRITE cycle time ( $t_{WRC}$ ) is the time from a valid stop condition of a write sequence to the end of the EEPROM internal erase/program cycle. During the WRITE cycle, the EEPROM bus interface circuit is disabled, SDA remains HIGH due to pull-up resistor, and the EEPROM does not respond to its slave address.
24.  $V_{IH}$  overshoot:  $V_{IH}(\text{MAX}) = V_{DD} + 2V$  for a pulse width  $\leq 10\text{ns}$ , and the pulse width cannot be greater than one third of the cycle rate.  $V_{IL}$  undershoot:  $V_{IL}(\text{MIN}) = -2V$  for a pulse width  $\leq 10\text{ns}$ , and the pulse width cannot be greater than one third of the cycle rate.
25. The clock frequency must remain constant during access or precharge states (READ, WRITE, including  $t_{WR}$ , and PRECHARGE commands). CKE may be used to reduce the data rate.
26. Auto precharge mode only. The precharge timing budget ( $t_{RP}$ ) begins  $8\text{ns}$  after the first clock delay, after the last WRITE is executed.
27. Precharge mode only.
28. JEDEC and PC100 specify three clocks.
29. These five parameters vary between speed grades and define the differences between the -8 SDRAM speeds: -8A, -8B, -8C, -8D and -8E. All other -8 timing parameters remain constant.
