

# 4Mb Ultra-Low Power Asynchronous CMOS SRAM w/ Dual Vcc and VccQ for Ultimate Power Reduction

## 256K×16 bit POWER SAVER TECHNOLOGY

### Overview

The N04Q16yyC2B are ultra-low power memory devices containing a 4 Mbit Static Random Access Memory organized as 262,144 words by 16 bits. The device is designed and fabricated using NanoAmp's advanced CMOS technology to provide ultra-low active and standby power. The device operates with two chip enable ( $\overline{CE1}$  and  $CE2$ ) controls and output enable ( $\overline{OE}$ ) to allow for easy memory expansion. Byte controls ( $\overline{UB}$  and  $LB$ ) allow the upper and lower bytes to be accessed independently. The 4Mb SRAM is optimized for the ultimate in low power and is suited for various applications where ultra-low-power is critical such as medical applications, battery backup and power sensitive hand-held devices. The unique page mode operation saves active operating power and the dual power supply rails allow very low voltage operation while maintaining 3V I/O capability. The device can operate over a very wide temperature range of 0°C to +70°C for the lowest power and is also available in the industrial range of -40°C to +85°C. The devices are available in standard BGA and TSOP packages. The devices are also available as Known Good Die (KGD) for embedded package applications.

### Features

- **Multiple Power Supply Ranges**  
 1.1V - 1.3V  
 1.65V - 1.95V  
 2.3V - 2.7V  
 2.7V - 3.6V
- **Dual Vcc / VccQ Power Supplies**  
 1.2V Vcc with 3V VccQ  
 1.8V Vcc with 3V VccQ  
 2.5V Vcc with 3V VccQ
- **Very low standby current**  
 50nA typical for 1.2V operation
- **Very low operating current**  
 400µA typical for 1.2V operation at 1µs
- **Very low Page Mode operating current**  
 80µA typical for 1.2V operation at 1µs
- **Simple memory control**  
 Dual Chip Enables ( $\overline{CE1}$  and  $CE2$ )  
 Byte control for independent byte operation  
 Output Enable ( $\overline{OE}$ ) for memory expansion
- **Automatic power down to standby mode**
- **BGA, TSOP and KGD options**
- **RoHS Compliant**

1. When  $\overline{UB}$  and  $\overline{LB}$  are in select mode (low),  $I/O_0 - I/O_{15}$  are affected as shown. When  $\overline{LB}$  only is in the select mode only  $I/O_0 - I/O_7$  are affected as shown. When  $\overline{UB}$  is in the select mode only  $I/O_8 - I/O_{15}$  are affected as shown.

2. When the device is in standby mode, control inputs ( $\overline{WE}$ ,  $\overline{OE}$ ,  $\overline{UB}$ , and  $\overline{LB}$ ), address inputs and data input/outputs are internally isolated from any external influence and disabled from exerting any influence externally.

3. When  $\overline{WE}$  is invoked, the  $\overline{OE}$  input is internally disabled and has no effect on the circuit.

## Capacitance<sup>1</sup>

Item	Symbol	Test Condition	Min	Max	Unit
Input Capacitance	$C_{IN}$	$V_{IN} = 0V, f = 1 \text{ MHz}, T_A = 25^\circ\text{C}$		8	pF
I/O Capacitance	$C_{I/O}$	$V_{IN} = 0V, f = 1 \text{ MHz}, T_A = 25^\circ\text{C}$		8	pF

1. These parameters are verified in device characterization and are not 100% tested

## Absolute Maximum Ratings<sup>1</sup>

Item	Symbol	Rating	Unit
Voltage on any pin relative to $V_{SS}$	$V_{IN,OUT}$	-0.3 to $V_{CC}+0.3$	V
Voltage on $V_{CC}$ Supply Relative to $V_{SS}$	$V_{CC}$	-0.3 to 4	V
Power Dissipation	$P_D$	500	mW
Storage Temperature	$T_{STG}$	-40 to 125	°C
Operating Temperature	$T_A$	-40 to +85	°C
Soldering Temperature and Time	$T_{SOLDER}$	260°C, 10sec	°C

1. Stresses greater than those listed above may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operating section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

1. Typical values are measured at  $V_{CC}=V_{CC} \text{ Typ.}, T_A=25^\circ\text{C}$  and not 100% tested.

2. This device assumes a standby mode if the chip is disabled ( $\overline{\text{CE}}1$  high or  $\overline{\text{CE}}2$  low). In order to achieve low standby current all inputs must be within 0.2 volts of either VCC or VSS. This applies to all I<sub>SB</sub> values.

3. This parameter is specified with the outputs disabled to avoid external loading effects. The user must add current required to drive output capacitance expected in the actual system. This applies to all I<sub>CC</sub> and I<sub>CCP</sub> values.

## Power Savings with Page Mode Operation ( $\overline{WE} = V_{IH}$ )

Note: Page mode operation is a method of addressing the SRAM to save operating current. The internal organization of the SRAM is optimized to allow this unique operating mode to be used as a valuable power saving feature.

The only thing that needs to be done is to address the SRAM in a manner that the internal page is left open and 16-bit words of data are read from the open page. By treating addresses A1 - A4 as the least significant bits and addressing the 16 words within the open page, power is reduced to the page mode value which is considerably lower than standard operating currents for low power SRAMs.
