NB100LVEP221

2.5V/3.3V 2:1:20 Differential HSTL/ECL/PECL Clock Driver

ON Semiconductor®

www.onsemi.com

Description

The NB100LVEP221 is a low skew 2:1:20 differential clock driver, designed with clock distribution in mind, accepting two clock sources into an input multiplexer. The two clock inputs are differential ECL/PECL; CLK1/$\overline{\text{CLK1}}$ can also receive HSTL signal levels. The LVPECL input signals can be either differential configuration or single−ended (if the V_{BB} output is used).

The LVEP221 specifically guarantees low output−to−output skew. Optimal design, layout, and processing minimize skew within a device and from device to device.

To ensure tightest skew, both sides of differential outputs should be terminated identically into 50 Ω even if only one output is being used. If an output pair is unused, both outputs may be left open (unterminated) without affecting skew.

The NB100LVEP221, as with most other ECL devices, can be operated from a positive V_{CC} supply in LVPECL mode. This allows the LVEP221 to be used for high performance clock distribution in +3.3 V or +2.5 V systems. In a PECL environment, series or Thevenin line terminations are typically used as they require no additional power supplies. For more information on PECL terminations, designers should refer to Application Note AND8020/D.

The V_{BB} pin, an internally generated voltage supply, is available to this device only. For single−ended LVPECL input conditions, the unused differential input is connected to V_{BB} as a switching reference voltage. V_{BB} may also rebias AC coupled inputs. When used, decouple V_{BB} and V_{CC} via a 0.01 μF capacitor and limit current sourcing or sinking to 0.5 mA. When not used, V_{BB} should be left open.

Single−ended CLK input operation is limited to a $V_{CC} \geq 3.0$ V in LVPECL mode, or $V_{EE} \leq -3.0$ V in NECL mode.

Features

- 15 ps Typical Output−to−Output Skew
- 40 ps Typical Device−to−Device Skew
- Jitter Less than 2 ps RMS
- Maximum Frequency > 1.0 GHz Typical
- Thermally Enhanced 52−Lead LQFP and QFN
- V_{BB} Output
- 540 ps Typical Propagation Delay
- LVPECL and HSTL Mode Operating Range:
  V_{CC} = 2.375 V to 3.8 V with V_{EE} = 0 V
- NECL Mode Operating Range:
  V_{CC} = 0 V with V_{EE} = −2.375 V to −3.8 V
- Q Output will Default Low with Inputs Open or at V_{EE}
- Pin Compatible with Motorola MC100EP221
- These Devices are Pb−Free and are RoHS Compliant

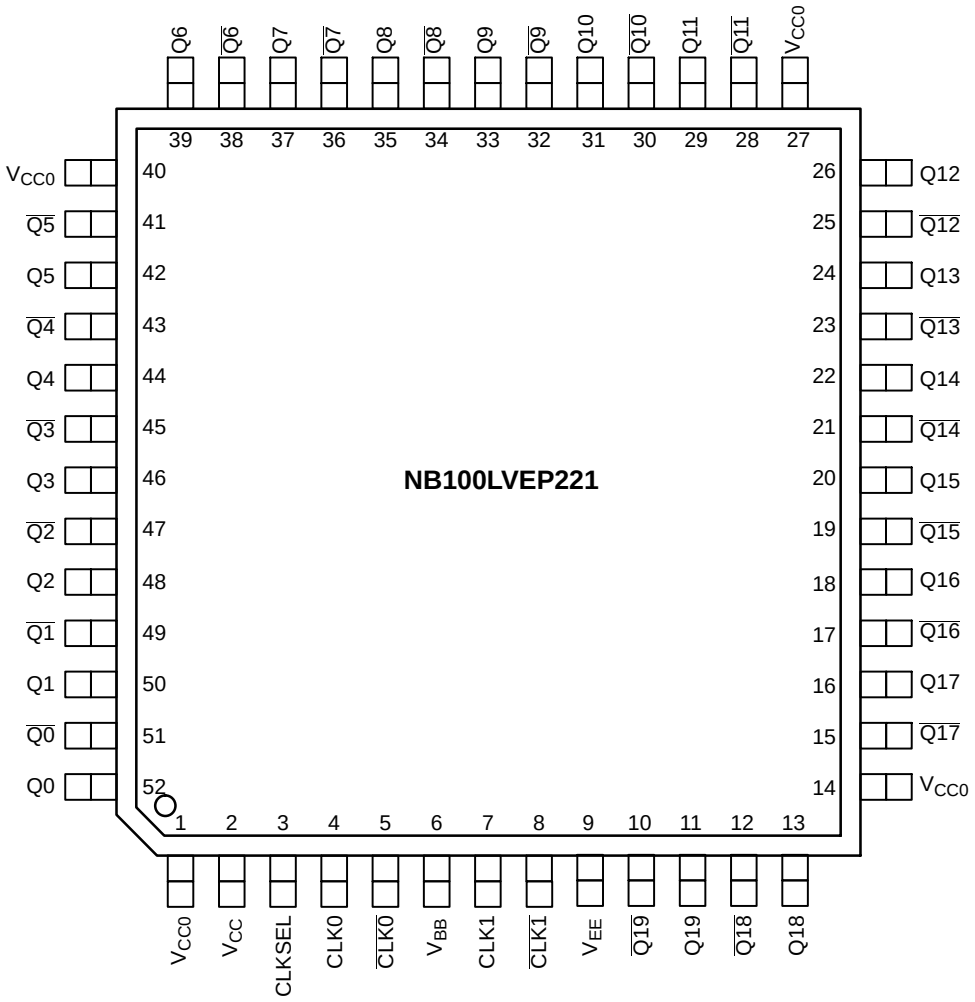
ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 10 of this data sheet.



All V_{CC}, V_{CCO}, and V_{EE} pins must be externally connected to appropriate Power Supply to guarantee proper operation. The thermally conductive exposed pad on package bottom (see package case drawing) must be attached to a heat−sinking conduit, capable of transferring 1.2 Watts. This exposed pad is electrically connected to V_{EE} internally.

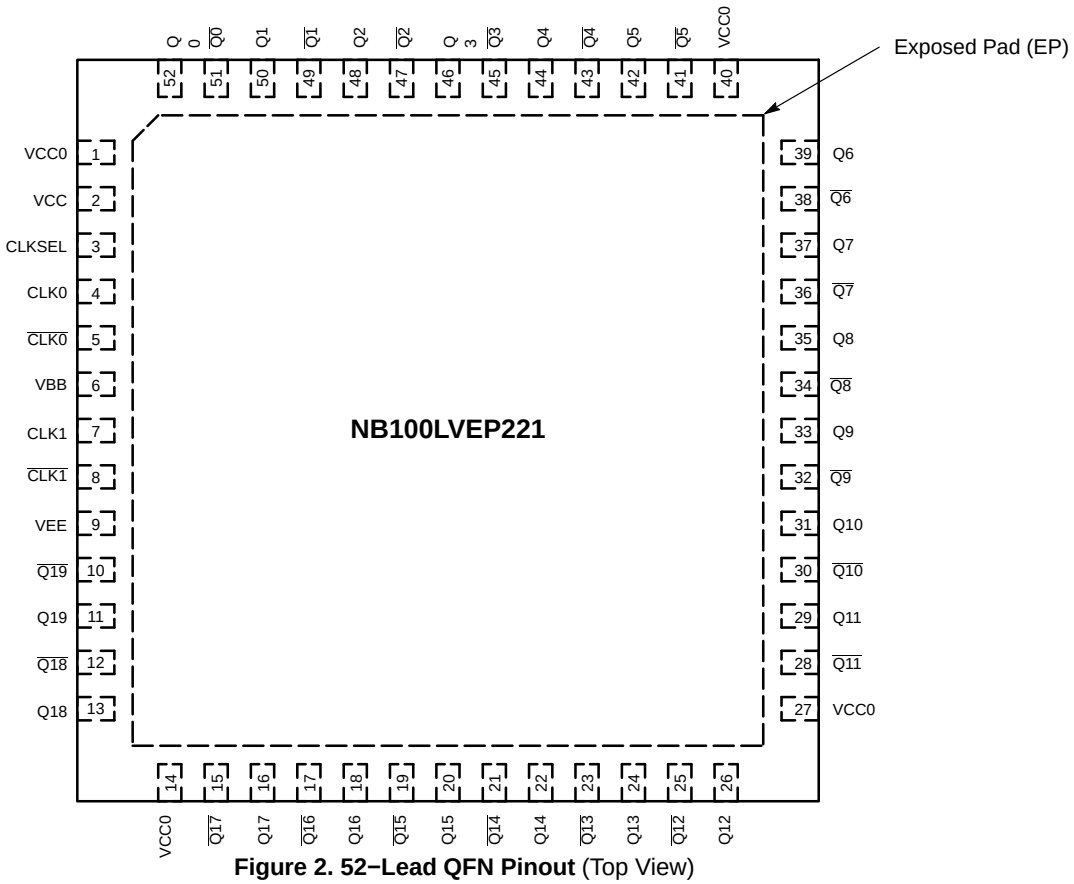

Figure 2. 52−Lead QFN Pinout (Top View)

Table 1. PIN DESCRIPTION

PIN	FUNCTION
CLK0*, $\overline{\text{CLK0}}$**	ECL/PECL Differential Inputs
CLK1*, $\overline{\text{CLK1}}$**	ECL/PECL or HSTL Differential Inputs
Q0:19, $\overline{\text{Q0:19}}$	ECL/PECL Differential Outputs
CLK_SEL*	ECL/PECL Active Clock Select Input
V_{BB}	Reference Voltage Output
V_{CC}/V_{CCO}	Positive Supply
V_{EE}***	Negative Supply

* Pins will default LOW when left open.
** Pins will default HIGH when left open.
*** The thermally conductive exposed pad on the bottom of the package is electrically connected to V_{EE} internally.

APPLICATIONS INFORMATION

Using the thermally enhanced package of the NB100LVEP221

The NB100LVEP221 uses a thermally enhanced 52−lead LQFP package. The package is molded so that a portion of the leadframe is exposed at the surface of the package bottom side. This exposed metal pad will provide the low thermal impedance that supports the power consumption of the NB100LVEP221 high−speed bipolar integrated circuit and will ease the power management task for the system design. In multilayer board designs, a thermal land pattern on the printed circuit board and thermal vias are recommended to maximize both the removal of heat from the package and electrical performance of the NB100LVEP221. The size of the land pattern can be larger, smaller, or even take on a different shape than the exposed pad on the package. However, the solderable area should be at least the same size and shape as the exposed pad on the package. Direct soldering of the exposed pad to the thermal land will provide an efficient thermal conduit. The thermal vias will connect the exposed pad of the package to internal copper planes of the board. The number of vias, spacing, via diameters and land pattern design depend on the application and the amount of heat to be removed from the package.

Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern.

The recommended thermal land design for NB100LVEP221 applications on multi−layer boards comprises a 4 X 4 thermal via array using a 1.2 mm pitch as shown in Figure 8 providing an efficient heat removal path.

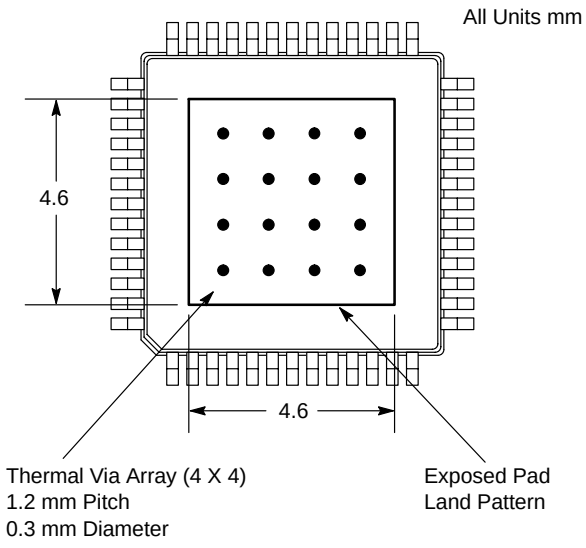

Figure 8. Recommended Thermal Land Pattern

The via diameter should be approximately 0.3 mm with 1 oz. copper via barrel plating. Solder wicking inside the via may result in voiding during the solder process and must be avoided. If the copper plating does not plug the vias, stencil print solder paste onto the printed circuit pad. This will supply enough solder paste to fill those vias and not starve the solder joints. The attachment process for the exposed pad package is equivalent to standard surface mount packages. Figure 9, “Recommended solder mask openings”, shows a recommended solder mask opening with respect to a 4 X 4 thermal via array. Because a large solder mask opening may result in a poor rework release, the opening should be subdivided as shown in Figure 9. For the nominal package standoff of 0.1 mm, a stencil thickness of 5 to 8 mils should be considered.

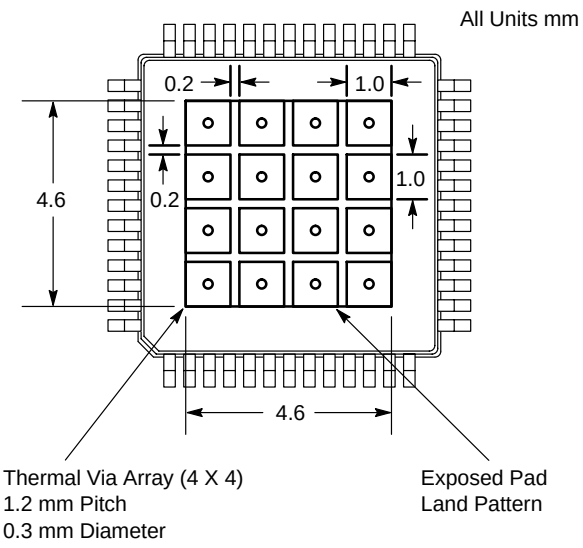

Figure 9. Recommended Solder Mask Openings

Proper thermal management is critical for reliable system operation. This is especially true for high−fanout and high output drive capability products.

For thermal system analysis and junction temperature calculation, the thermal resistance parameters of the package are provided:

Table 10. Thermal Resistance *

lfpm	θJA °C/W	θJC °C/W
0	35.6	3.2
100	32.8	4.9
500	30.0	6.4

* Junction to ambient and Junction to board, four−conductor layer test board (2S2P) per JESD 51−8

These recommendations are to be used as a guideline, only. It is therefore recommended that users employ sufficient thermal modeling analysis to assist in applying the general recommendations to their particular application to assure adequate thermal performance. The exposed pad of the NB100LVEP221 package is electrically shorted to the substrate of the integrated circuit and V_{EE}. The thermal land should be electrically connected to V_{EE}.
