

NCP4681, NCP4684

150 mA, Ultra Low Quiescent Current, Low Dropout Regulator

The NCP4681 and NCP4684 are CMOS Linear voltage regulators with 150 mA output current capability and ultra low supply currents (1 μ A typ.) The devices are easy to use and include output current protection and a fully integrated soft-start circuit to minimize inrush current and to ensure no output voltage overshoot. The NCP4681 includes an Enable function to reduce supply current by using a Standby mode, while the NCP4684 excludes the Enable pin to avoid any pull down current, thereby offering the lowest possible current consumption for battery powered applications in Active mode. For portable products the devices are available in the exceptionally small 0.8 x 0.8 mm XDFN, along with the SC-70 and SOT23 packages

Features

- Operating Input Voltage Range: 1.40 V to 5.25 V
- Output Voltage Range: 0.8 V to 3.6 V (available in 0.1 V steps)
- Output Voltage Accuracy: $\pm 1.0\%$
- Supply Current: 1 μ A (excluding the CE pull down current)
- Dropout Voltage: 0.28 V ($I_{OUT} = 150$ mA, $V_{OUT} = 2.8$ V)
- Line Regulation: 0.02%/V Typ.
- Stable with Ceramic Capacitors: 0.1 μ F or more
- Current Fold Back Protection
- Build-in Constant Slope Circuit for soft-start function
- Available in XDFN4 0.8 x 0.8 mm, SC-70, SOT23 Packages
- These are Pb-Free Devices

Typical Applications

- Battery-powered Equipment
- Networking and Communication Equipment
- Cameras, DVRs, STB and Camcorders
- Home Appliances

ABSOLUTE MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Input Voltage (Note 1)	V_{IN}	6.0	V
Output Voltage	V_{OUT}	-0.3 to $V_{IN} + 0.3$	V
Chip Enable Input	V_{CE}	6.0	V
Output Current	I_{OUT}	180	mA
Power Dissipation XDFN0808	P_D	286	mW
Power Dissipation SC-70		380	
Power Dissipation SOT23		420	
Junction Temperature	T_J	-40 to 150	°C
Storage Temperature	T_{STG}	-55 to 125	°C
ESD Capability, Human Body Model (Note 2)	ESD_{HBM}	2000	V
ESD Capability, Machine Model (Note 2)	ESD_{MM}	200	V

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. Refer to ELECTRICAL CHARACTERISTICS and APPLICATION INFORMATION for Safe Operating Area.
2. This device series incorporates ESD protection and is tested by the following methods:
 ESD Human Body Model tested per AEC-Q100-002 (EIA/JESD22-A114)
 ESD Machine Model tested per AEC-Q100-003 (EIA/JESD22-A115)
 Latch-up Current Maximum Rating tested per JEDEC standard: JESD78.

THERMAL CHARACTERISTICS

Rating	Symbol	Value	Unit
Thermal Characteristics, XDFN 0.8 x 0.8 mm Thermal Resistance, Junction-to-Air	$R_{\theta JA}$	350	°C/W
Thermal Characteristics, SOT23 Thermal Resistance, Junction-to-Air	$R_{\theta JA}$	238	°C/W
Thermal Characteristics, SC-70 Thermal Resistance, Junction-to-Air	$R_{\theta JA}$	263	°C/W

APPLICATION INFORMATION

A typical application circuits for NCP4681 and NCP4684 series are shown in Figure 41.

Figure 41. Typical Application Schematics

Input Decoupling Capacitor (C1)

A 0.1 μF ceramic input decoupling capacitor should be connected as close as possible to the input and ground pin of the NCP4681/4. Higher values and lower ESR improves line transient response.

Output Decoupling Capacitor (C2)

A 0.1 μF ceramic output decoupling capacitor is enough to achieve stable operation of the IC. If a tantalum capacitor is used, and its ESR is high, loop oscillation may result. The capacitors should be connected as close as possible to the

output and ground pins. Larger capacitor values and lower ESR improves dynamic parameters.

Enable Operation (NCP4681 Only)

The enable pin CE may be used for turning the regulator on and off. The IC is switched on when a high level voltage is applied to the CE pin. The enable pin has an internal pull down current source. If the enable function is not needed connect CE pin to VIN.

Constant Slope Circuit

The constant slope circuit is used as a soft start circuit that allows the output voltage to start up slowly with a defined slope. This circuit minimizes inrush current at start up and also prevents against overshoot of the output voltage. The Constant slope circuit is fully built in and no external components are needed. Start up time and the output voltage slope is defined internally and there is no way for the user to change it. Start up into bigger output capacitor doesn't make any problem due to cooperation of constant slope circuit and current limit circuit.

Current Limit

This regulator includes a fold-back current limiting circuit. This type of protection doesn't limit output current up to specified current capability in normal operation, but when an over current situation occurs, the output voltage and current decrease until the over current condition ends. Typical characteristics of this protection scheme are shown in the Output voltage versus Output current graphs in the characterization section of this datasheet.

NCP4681, NCP4684

Output Discharger

The NCP4681D version includes a transistor between VOUT and GND that is used for faster discharging of the output capacitor. This function is activated when the IC goes into disable mode.

Thermal

As power across the IC increase, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration

on the PCB, the board material, and also the ambient temperature affect the rate of temperature increase for the part. When the device has good thermal conductivity through the PCB the junction temperature will be relatively low in high power dissipation applications.

PCB layout

Make the VIN and GND line as large as practical. If their impedance is high, noise pickup or unstable operation may result. Connect capacitors C1 and C2 as close as possible to the IC, and make wiring as short as possible.
