

4-BIT SINGLE CHIP OTP TINY CONTROLLER

■ GENERAL DESCRIPTION

The **NJU3151** is the C-MOS 4-bit Single Chip OTP type Micro Controller with programmable Flash Memory.

It is completely compatible with the **NJU3101** in function and the pin configuration. Therefore, the **NJU3151** is suitable for the final evaluation before **NJU3101** mask generation, the small quantity production and short lead-time.

* *In this data sheet, only OTP programming and the difference between **NJU3151** and **NJU3101** are mentioned mainly. Therefore the detail function and specification should be referred on the **NJU3101** data sheet.*

■ Difference between NJU3151 (OTP version) and NJU3101 (MASK version)

● Operating mode

NJU3151 has two operating modes. One is "Normal operating mode" and the other is "OTP programming mode".

• Normal operating mode

The "TEST" terminal is set to low level. (The terminal is recommended to connect to GND.)
 Operating voltage range; 2.7V ~ 5.5V.

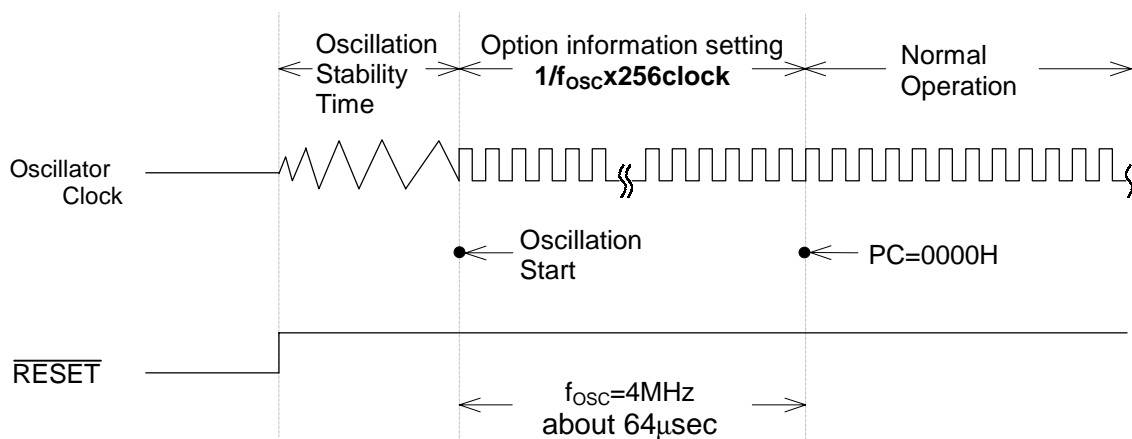

• OTP Programming mode

User program is read out from or written into the OTP by the universal programmer "SUPERPRO/L" and converting adapter made by XELTEK co.,(USA).

● Option information set in the initialization

When the initialization is performed ($\overline{\text{RESET}}$ terminal is "L"), the operation information stored in option area is set as shown in the following timing chart. The option information is set in the term of **$1 / f_{osc} \times 256\text{clock}$** after RESET releasing and oscillation stability time. After information set, the program counter is set to 0000H and the **NJU3151** operates in normal.
