

AUDIO PROCESSOR with SOUND ENHANCEMENT and SRS 3D STEREO

■ GENERAL DESCRIPTION

The NJW1160 is an audio processor that includes Sound enhancement (BBE) and SRS 3D Stereo. It includes all of the audio signal processing functions for TV such as tone control, balance, volume, mute, and AGC .

The SRS 3D stereo technology reproduces 3D stereo surround sound effect using only two speakers.

The sound enhancement regenerates high definitive and nearly real sound.

All of internal status and variables are controlled by I²C BUS interface.

■ PACKAGE OUTLINE

NJW1160L

NJW1160M

■ FEATURES

- Operating Voltage 7.5 to 13V
- I²C BUS Interface
- BBE Sound Enhancement (Low Boost and High Boost: 15dB max.)
- AGC Circuit (It reduces volume difference among input sources.)
- SRS 3D Stereo
- Simulated Surround
- Bi-CMOS Technology
- Package Outline SDIP30, SDMP30

APPLICATION CIRCUIT

(NOTE)

1. Separate the I²C bus line from the following terminals for avoiding digital noise problem.

Pin No.	Symbol	Pin No.	Symbol	Pin No.	Symbol	Pin No.	Symbol	Pin No.	Symbol
2	BBE1a	6	TONE-Ha	10	SRS/SS-FIL1	24	TONE-Lb	28	BBE2b
3	BBE2a	7	TONE-La	22	SRS-FIL2	25	TONE-Hb	29	BBE1b

- The constant of capacitors connected to the terminals No.2, 3, 28 and 29 are designated by BBE Sound Inc. Do not change the constant of these capacitors without the approval of BBE Sound Inc.
- The constant of capacitors connected to the terminals No.10 and 22 are designated by SRS Labs. Do not change the constant of these capacitors without the approval of SRS Labs.

APPLICATION NOTE

1. AGC (Auto Gain Control) Circuit

AGC circuit adjusts the input signal level with Boost/Attenuate circuit. AGC boost the low input signal level and attenuate high input signal level automatically.

The AGC flat levels (150mV, 300mV, 400mV and 540mV) are selectable via I²C bus. (Refer to the following figure.)

Attack-Recovery

Smoothing circuit of Attenuate

Smoothing circuit of Boost

Attack and recovery time in the attenuation processing depends on external part Ca, and it in the boost processing depends on external part Cb. They become longer as the capacity bigger and become shorter as it gets smaller. (Recommendation value: Ca=1μF, Cb=4.7μF)

Reducing the capacity of Ca may cause the distortion. As for Cb, since it serves as the click noise prevention, reducing the capacity may cause the click noise upon volume changing.

2. Tone Control

a) Bass: Setting the Cut-off frequency

$$f_c = \frac{M}{2\pi \times C \times 12k}$$

M changes by gain setting of Tone.

$$M \approx 2.65 \quad (\pm 15\text{dB})$$

$$M \approx 3.45 \quad (\pm 10\text{dB})$$

$$M \approx 8.10 \quad (\pm 5\text{dB})$$

b) Treble: Setting the Cut-off frequency

$$f_c = \frac{N}{2\pi \times C \times 10k}$$

N changes by gain setting of Tone.

$$N \approx 0.76 \quad (\pm 15\text{dB})$$

$$N \approx 0.58 \quad (\pm 10\text{dB})$$

$$N \approx 0.25 \quad (\pm 5\text{dB})$$

3. BBE, Surround mode and "OUT" switch settings

The click noise may be generated by changing the BBE, Surround mode setting and "OUT" switch. Provide the external circuit for avoiding the click noise on above condition.

4. External parts for BBE circuits

The constant of capacitors connected to the terminals No.2, 3, 28 and 29 are designated by BBE Sound Inc. Do not change the constant of these capacitors without the approval of BBE Sound Inc.

5. AUX1, AUX0 Terminal

AUX1/0 are enable to control external logic circuit is

Source current : 1mA typ. (Ta=25°C)

Sink current : 0.5mA typ. (Ta=25°C)

6. Capacitor for Reference Voltage (21pin)

22μF should be recommended for ripple filter connected to Vref terminal (21pin).

Reducing this capacity may cause to reduce the maximum attenuation level and to increase the output noise.

■ DEFINITION OF I²C REGISTER

◆ I²C BUS FORMAT

S: Starting Term
 A: Acknowledge Bit
 P: Ending Term

◆ SLAVE ADDRESS

$\overline{R/W}=0$: Receive Only
 $\overline{R/W}=1$: No Output Data

◆ CONTROL REGISTER TABLE

The select address sets each function (Volume, Balance, AGC, Surround, Tone Control, BBE, AUX).
 The auto increment function cycles the select address as follows.
 00H→01H→02H→03H→04H→05H→00H
