NT 511740C5J
Data Sheet

TABLE OF CONTENTS

1. DESCRIPTION

The NT511740C5J is a 4,194,304-word x 4-bit dynamic RAM fabricated in NTC's CMOS silicon gate technology. The NT511740C5J achieves high integration , high-speed operation , and low-power consumption due to quadruple polysilicon double metal CMOS. The NT511740C5J is available in a 26/24-pin plastic SOJ.

2. FEATURES

- 4,194,304-word x 4-bit configuration
- Single 5V power supply,+/-10% tolerance
- Input :TTL compatible , low input capacitance
- Output :TTL compatible , 3-state
- Refresh :2048 cycles/32 ms
- Fast page mode with EDO, read modify write capability
- /CAS before /RAS refresh, hidden refresh, /RAS-only refresh capability
- Multi-bit test mode capability
- Package options:

26/24-Pin 300 mil plastic SOJ (SOJ26/24-P300) (Product:NT511740C5J-XX)
XX indicates speed rank.

3. PRODUCT FAMILY

Family	Access Time (Max.)				Cycle Time	Power Dissipation

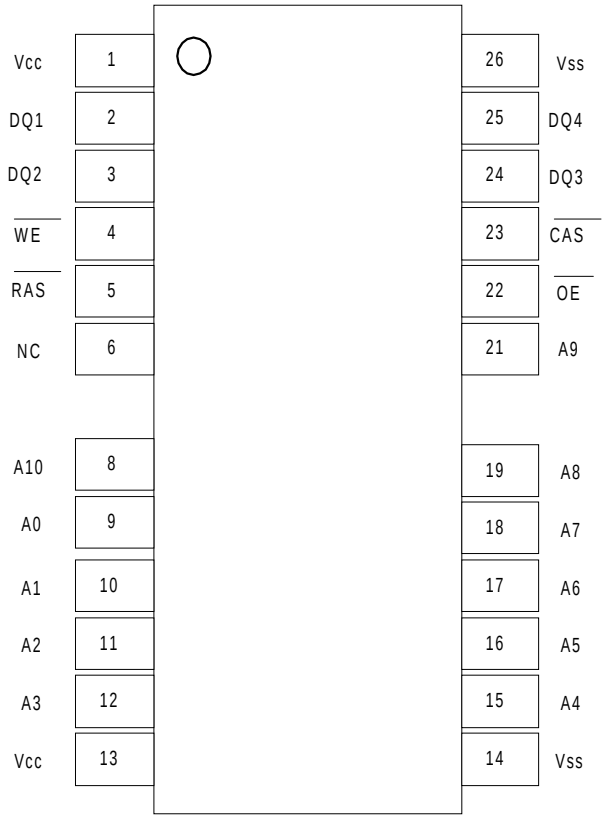
4. PIN CONFIGURATION (TOPVIEW)



26/24-Pin Plastic SOJ

Pin Name	Function
A0-A10	Adress input
$\overline{RAS}$	Row Adress Strobe
$\overline{CAS}$	Column Adress Strobe
DQ1-DQ4	Data Input/Data Output
$\overline{OE}$	Output Enable
$\overline{WE}$	Write Enable
Vcc	Power Supply (5v)
Vss	Ground(0V)
NC	No Connection

Note:The same power supply voltage must be provided to every Vcc pin , and the same GND voltage level must be provided to every Vss pin.

Notes:

1. A start-up delay of 200 μs is required after po/WEr-up,follo/WEd by a minimum of eight initialization cycles (/RAS-only refresh or /CAS before /RAS refresh) before proper device operation is achieved.
2. The AC characteristics assume t_T=2 ns.
3. V_{IH}(Min.) and V_{IL}(Max.) are reference levels for measuring input timing signals. Transition time (t_T) are measured bet/WEen V_{IH} and V_{IL}.
4. This parameter is measured with a load circuit equivalent to 2 TTL loads and 100 pF.
5. Operation within the t_{RCD} (Max.) limit ensures that t_{RAC} (Max.) can be met. t_{RCD} (Max.) is specified as a reference point only . If t_{RCD} is greater than the specified t_{RCD} (Max.) limit, access time is controlled by t_{CAC}.
6. Operation within the t_{RAD} (Max.) limit ensures that t_{RAC} (Max.) can be met. t_{RAD} (Max.) is specified as a reference point only . If t_{RAD} is greater than the specified t_{RAD} (Max.) limit, access time is controlled by t_{AA}.
7. t_{CEZ} (Max.), t_{REZ} (Max.), $t_{/WEZ}$ (Max.) and $t_{/OEZ}$ (Max.) define the time at which the output achieves the open circuit condition and are not referenced to output voltage levels.
8. t_{CEZ} and t_{REZ} must be satisfied for open circuit condition .
9. t_{RCH} or t_{RRH} must be satisfied for a read cycle.
10. t_{WCS}, t_{CWD}, t_{RWD}, t_{AWD}, and t_{CPWD} are not restrictive operating parameters. They are included in the data sheet as electrical characteristics only . If t_{WCS} t_{WCS}(Min.), the cycle is an early write cycle and the data out will remain open circuit (high impedance) throughout the entire cycle. If t_{CWD} t_{CWD}(Min.) , t_{RWD} t_{RWD}(Min.) , t_{AWD} t_{AWD}(Min.) and t_{CPWD} t_{CPWD}(Min.), the cycle is a read modify write cycle and data out will contain data read from the selected cell; if neither of the above sets of conditions is satisfied, the condition of the data out (at access time) is indeterminate.
11. These parameters are referenced to /CAS leading edge in an early write cycle, and to /WE leading edge in an /OE control write cycle or a read modify write cycle .
12. The test mode is initiated by performing a /WE and /CAS before /RAS refresh cycle. This mode is latched and remains in effect until the exit cycle is generated. In a test mode CA0 and CA1 are not used and each DQ pin now accesses 8-bit locations .Since all 4 DQ pins are used, a total of 32 data bits can be written in parallel into the memory array. In a read cycle, if 8 data bits are equal the DQ pin will indicate a high level. If the 8 data bits are not equal, the DQ pin will indicate a low level. The test mode is cleared and the memory device returned to its normal operating state by performing a /RAS-only refresh cycle or a /CAS before /RAS refresh cycle.
13. In a test mode read cycle , the value of access time parameters is delayed for 5 ns for the specified value . These parameters should be specified in test mode cycle by adding the above value to the specified value in this data sheet.
