Detector AC Set-Up Procedure: (SW1, 4 position 1, $V_{AGC} = 0\text{V}$)

1. Apply $v_{DET} = 10\text{mV}_{\text{rms}}$, 45.75MHz CW at the detector input. Tune L1 for maximum AC signal at Pin25, measured with a 10x FET probe or through a 1pF capacitor to prevent loading of the limiter tank.
2. Increase v_{DET} to 60mV_{rms} . Adjust L3 until the PLL locks, as indicated by a DC voltage at the video output Pin16.
3. With the detector locked, adjust L3 for 4V at Pin18.
4. Adjust V_{PH} for maximum detector efficiency by monitoring Pin16 for a minimum DC voltage.
5. Adjust L2 for 3.0V at Pin27 (on sensitive slope of AFC curve).
