DESCRIPTION

The PLL103-02 is designed as a 2.5V buffer to distribute high-speed clocks in PC applications. The device has 24 outputs. These outputs can be configured to support four unbuffered DDR DIMMS. The PLL103-02 can be used in conjunction with a clock synthesizer for the VIA Pro 266 chipset. The PLL103-02 also has an I2C interface, which can enable or disable each output clock. When powered up, all output clocks are enabled (have internal pull ups).

PIN DESCRIPTIONS

Name	Number	Type	Description
FBOUT	1	O	Feedback clock for chipset.
BUF_IN	13	I	Reference input from chipset.

I2C BUS CONFIGURATION SETTING

Address Assignment	A6 1	A5 1	A4 0	A3 1	A2 0	A1 0	A0 1	R/W -
Slave Receiver/Transmitter	Provides both slave write and readback functionality							
Data Transfer Rate	Standard mode at 100kbits/s							
Data Protocol	<p>This serial protocol is designed to allow both blocks write and read from the controller. The bytes must be accessed in sequential order from lowest to highest byte. Each byte transferred must be followed by 1 acknowledge bit. A byte transferred without acknowledged bit will terminate the transfer. The write or read block both begins with the master sending a slave address and a write condition (0xD2) or a read condition (0xD3).</p> <p>Following the acknowledge of this address byte, in Write Mode: the Command Byte and Byte Count Byte must be sent by the master but ignored by the slave, in Read Mode: the Byte Count Byte will be read by the master then all other Data Byte. Byte Count Byte default at power-up is = (0x09).</p>
