Application Circuit

If the impedance of V_{CC} line is high enough, connect a capacitor between V_{CC} and GND terminal of the IC. *

* : When the rapid noise occurs to V_{CC}, V_{OUT} has sometimes switched over even if V_{CC} doesn't become below V_s.

"H" transmission delay time can be calculated roughly using the following formula, but there is some fluctuation due to element deviation and the V_{CC} input signal (dV/dT).

$$T_{PLH} [ms] \approx C_d [\mu F] \times d$$

d: delay time coefficient
