UNCTION DESCRIPTION

CONTROL DATA BITS

CU: NORMAL MODE CURRENT DRAIN CONTROL DATA BIT

This control bit is used to select the current drain (either Normal Current Drain or Low Current Drain) in the Normal Mode. Please refer to the table below.

CU	Current Drain (under the Normal Mode)
0	Normal Current Drain (IDD2, IDD3)
1	Low Current Drain (IDD4, IDD5)

It should be noted that when the Low Current Drain is selected by setting the CU to “1”, the output waveforms of the common and segment driver are easily distorted since the capacity to supply the current to the LCD panel from the Common and Segment Pins is less than capacity under the Normal Current Drain (CU = “0”).

P0 TO P3: SEGMENT / GENERAL PURPOSE OUTPUT PORT SELECT BITS

These control bits are used to select the function of the SG1/P1 to SG12/P12 output pins (either Segment Output Pins or General Purpose Output Pins). Please refer to the table below.

Control Data				Output Pins											
P0	P1	P2	P3	SG1/ P1	SG2/ P2	SG3/ P3	SG4/ P4	SG5/ P5	SG6/ P6	SG7/ P7	SG8/ P8	SG9/ P9	SG10 /P10	SG11 /P11	SG12/ P12

When the General Purpose Output Port Function is selected, the correspondence between the output pins and the respective display data is given in the table below.

Output Pin	Corresponding Display Data	Output Pin	Corresponding Display Data
SG1/P1	D1	SG7/P7	D25
SG2/P2	D5	SG8/P8	D29
SG3/P3	D9	SG9/P9	D33
SG4/P4	D13	SG10/P10	D37
SG5/P5	D17	SG11/P11	D41
SG6/P6	D21	SG12/P12	D45

When the General Purpose Output Port Function is selected, the respective output pin is output a “HIGH” level when its corresponding display data is set to “1”. Likewise, it will output a “LOW” level, if its corresponding display data is set to “0”.

For example, SG4/P4 is used as a General Purpose Output Port, if its corresponding display data – D13 is set to “1”, then SG4/P4 will output “HIGH” level. Likewise, if D13 is set to “0”, then SG4/P4 will output “LOW” level.

DR: BIAS DRIVE TECHNIQUE CONTROL DATA BIT

This control bit is used to select either 1/2 Bias drive or 1/3 Bias Drive Technique. Please refer to the table below.

DR	Bias Drive Technique
0	1/3
1	1/2

SC: SEGMENT ON / OFF CONTROL DATA BIT

This control bit is used to select the state of the segment driver output pins. Please refer to the table below.

SC	Display State
0	ON
1	OFF

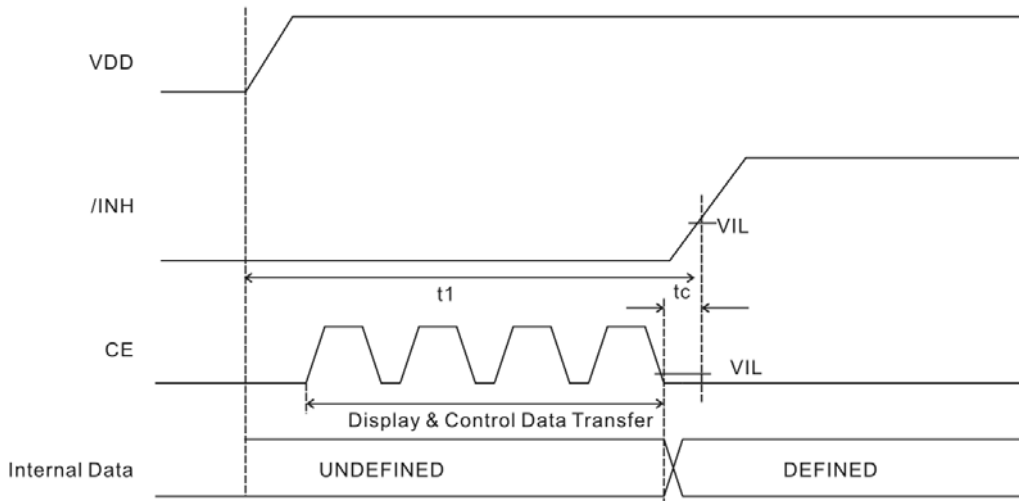

BU: NORMAL / POWER SAVING MODE SELECT BIT

This control bit is used to select either the Normal Mode or the Power Saving Mode. Please refer to the table below.

BU	Mode	Remarks
0	Normal Mode	-
1	Power Saving Mode	The oscillation circuit stops, the common and segment output pins are set to "LOW" level. It must be noted that the output pins - SG1/P1 to SG12/P12 may be used as General Purpose Output Ports by setting the control bits – P0 to P3.

DISPLAY CONTROL AND THE /INH PIN

When power is initialized, the internal data of PT6526 (that is, display data – D1 to D204 and the control data) are not defined. Irrelevant displays caused by the undefined internal data can be prevented by using the following procedures. The /INH pin must be set to “LOW” at the same time as the power is applied to turn OFF the display. Doing this will set the output pins – SG1/P1 to SG12/P12, SG13 to SG51 and COM1 to COM4 to “LOW” level. While the /INH pin is held at “LOW” level, the microcontroller must send the serial data. Then the application can set the /INH pin to “HIGH”. Please refer to the figure below.

Notes:

1. t_1 = determined by the value of C and R.
2. t_c = 10us (minimum)
