Product Description

The RF2362 is a low noise CDMA/TDMA PA driver amplifier with a very high dynamic range designed for transmit digital PCS applications at 1880MHz. The device functions as an outstanding PA driver amplifier in the transmit chain of digital subscriber units where low transmit noise power is a concern. The IC includes a power down feature that can be used to completely turn off the device. The IC is featured in a standard SOT 5-lead plastic package.

Pin	Function	Description	Interface Schematic
1	RF IN	RF input pin. This pin is DC-coupled and matched to 50Ω at 1880MHz.	
2	GND1	Ground connection. For best performance, keep traces physically short and connect immediately to ground plane.	
3	VPD	Power Down for the IC. $V_{PD} = 2.8V \pm 0.1V$ turns on the part. $V_{PD} < 0.9V$ turns off the part. External RF bypassing is required. The trace length between the pin and the bypass capacitors should be minimized. The ground side of the bypass capacitors should connect immediately to ground plane. Nominal current required for $V_{PD} = 2.8V$ is 8.5 mA typical and 12 mA Max (@ $V_{PD} = 2.9V$).	
4	RF OUT	Amplifier Output pin. This pin is an open-collector output. It must be biased to either V_{CC} or pin 4 through a choke or matching inductor. This pin is typically matched to 50Ω with a shunt bias/matching inductor and series blocking/matching capacitor. Refer to application schematics.	
5	GND2	Ground connection. For best performance, keep traces physically short and connect immediately to ground plane.
