

## **RF3802** GaAs HBT PRE-DRIVER AMPLIFIER

### **RoHS Compliant & Pb-Free Product**

### Typical Applications

- GaAs HBT Pre-Driver for Basestation Amplifiers
   Class AB Operation for GSM/EDGE/CDMA
- Power Amplifier Stage for Commercial Wireless Infrastructure
- **Transmitter Applications**

### **Product Description**

The RF3802 is specifically designed for wireless infrastructure applications. Using a highly reliable GaAs HBT fabrication process, this high-performance dual-stage amplifier achieves high output power over a broad frequency range. The RF3802 amplifier also provides excellent efficiency and thermal stability through the use of a thermally-enhanced surface-mount AIN package. Ease of integration is accomplished through the incorporation of an optimized evaluation board design provided to achieve proper 50 $\Omega$  operation. Various evaluation board configurations are available to address a broad range of wireless infrastructure applications:

- AMPS/GSM850/EDGE850 ٠
- GSM900/EDGE900 •
- IS-95/CDMA2000/AMPS

### **Optimum Technology Matching® Applied**

### **Functional Block Diagram**

Package Style: AIN

### Features

- 5W Output Power
- High Linearity
- 35% Power-Added Efficiency
- Thermally Enhanced AIN Packaging
- Broadband Platform Design Approach

#### Ordering Information

RF3802 GaAs HBT Pre-Driver Amplifier RF3802PCBA-410 Fully Assembled Evaluation Board - GSM850 RF3802PCBA-411 Fully Assembled Evaluation Board - GSM900

Pin	Function	Description
1	VCC1	For input stage.
2	VREF	Control for active bias.
3	RF IN	For input stage. Requires RF match and DC block.
4	VBIAS	Supply for active bias.
5	<b>RF OUT/VCC2</b>	For output stage. Requires RF match, bias feed and DC block.
6	<b>RF OUT/VCC2</b>	See pin 5.
7	<b>RF OUT/VCC2</b>	See pin 5.
8	<b>RF OUT/VCC2</b>	See pin 5.
Pkg Base	GND	Must be soldered to ground pad through as short a path as possible. This path also forms the thermal path for minimum ${\sf T}_J.$

### **PCB Design Requirements**

#### **PCB Surface Finish**

The PCB surface finish used for RFMD's qualification process is electroless nickel, immersion gold. Typical thickness is 3µinch to 8µinch gold over 180µinch nickel.

#### **PCB Land Pattern Recommendation**

PCB land patterns for PFMD components are based on IPC-7351 standards and RFMD empirical data. The pad pattern shown has been developed and tested for optimized assembly at RFMD. The PCB land pattern has been developed to accommodate lead and package tolerances. Since surface mount processes vary from company to company, careful process development is recommended.

#### **PCB Metal Land Pattern**

#### PCB Solder Mask Pattern

Liquid Photo-Imageable (LPI) solder mask is recommended. The solder mask footprint will match what is shown for the PCB metal land pattern with a 2mil to 3mil expansion to accommodate solder mask registration clearance around all pads. The center-grounding pad shall also have a solder mask clearance. Expansion of the pads to create solder mask clearance can be provided in the master data or requested from the PCB fabrication supplier.

#### Thermal Pad and Via Design

The DUT must be connected to the PCB backside ground through a low inductance, low thermal resistance path. The required interface is achieved with the via pattern shown below for both low inductance as well as low thermal resistance. The footprint provided below worked well on the RFMD 20mil thick Rogers 4350 PCB and also standard FR4. The vias are 8mil vias that are partially plated through and are finished to 8mils±2mils with a minimum plating of 1.5mil. Failure to place these vias within the DUT mounting area on the PCB in this prescribed manner may result in electrical performance and/or reliability degradation.

### **Tape and Reel Information**

Carrier tape basic dimensions are based on EIA481. The pocket is designed to hold the part for shipping and loading onto SMT manufacturing equipment, while protecting the boyd and the solder terminals from damaging stresses. The individual pocket design can vary from vendor to vendor, but wide and pitch will be consistent.

Carrier tape is wound or placed on a shipping reel with a diameter of either 330mm (13inches) or 178mm (7inches). The center hub design is large enough to ensure the radius formed by the carrier tape around it does not put unnecessary stress on the parts.

Prior to shipping, moisture sensitive parts (MSL level 2a to 5a) are baked and placed into the pockets of the carrier tape. A cover tape is sealed over the top of the entire length of the carrier tape. The reel is sealed in a moisture barrier, ESD bag, which is placed in a cardboard shipping box. It is important to note that unused moisture sensitive parts need to be resealed in the moisture barrier bag. If the reels exceed the exposure limit and need to be rebaked, most carrier tape and shipping reels are not rate as bakeable at 125°C. If baking is required, devices may be baked according to section 4, table 4-1, column 8 of Joint Industry Standard IPC/JEDECJ-STD-033A.

The following table provides useful information for carrier tape and reels used for shipping the devices described in this document.

RFMD Part Number	Reel Diameter Inch (mm)	Hub Diameter Inch (mm)	Width (mm)	Pocket Pitch (mm)	Feed	Units per Reel
RF3802TR13	13 (330)	4 (102)	12	8	Single	2500
RF3802TR7	7 (178)	2.4 (61)	12	8	Single	750
