

OVERVIEW

The SM8706A is a clock generator IC that generates 3 clocks with 6 outputs from a 36.8640MHz master clock for application in DVD players. The SM8706A has 2 built-in PLL circuits that together with a crystal oscillator can generate the 384fs and 768fs audio system clocks, 27MHz and 54MHz video system clocks, and 16.9344MHz and 33.8688MHz signal processor system clocks required for a DVD player. The SM8706A also supports the 44.1kHz and 48kHz sampling frequencies, and the sampling frequency can be switched while the device is operating.

FEATURES

- 36.8640MHz master clock (internal PLL reference clock)
- Generated clocks
 - Video system output: 27MHz, 54MHz
 - Audio system output: 384fs, 768fs
 - Signal processor system output: 16.9344MHz, 33.8688MHz
- Supported sampling frequency fs: 44.1/48kHz
- Low jitter output: 40ps (typ, 1-sigma, 25pF load)
- Supply voltage: 3.3V ± 0.3V
- 16-pin VSOP package

APPLICATIONS

- DVD players
- DVD car navigation system

PIN DESCRIPTION

Number	Name	I/O	Description
1	VDD1	-	Supply 1 for digital block
2	VSS1	-	Ground 1 for digital block
3	MO1	O	Video system output 1 (27MHz fixed)
4	MO2	O	Video system output 2 (54MHz fixed)
5	VDD2	-	Supply 2 for analog block
6	VSS2	-	Ground 2 for analog block
7	XTI	I	Crystal oscillator connection or external clock input
8	XTO	O	Crystal oscillator connection
9	AO1	O	Audio system output 1 (384fs output)
10	AO2	O	Audio system output 2 (768fs output)
11	VSS3	-	Ground 3 for digital block
12	VDD3	-	Supply 3 for digital block
13	SO1	O	Signal processor system output 1 (16.9344MHz fixed)
14	FSEL	I	Sampling frequency select FSEL = HIGH: fs = 48kHz FSEL = LOW: fs = 44.1kHz (with internal pull-up resistor, Schmitt-trigger input)
15	SO2	O	Signal processor system output 2 (33.8688MHz fixed)
16	CE	I	Chip enable (HIGH = Enable, LOW = Disable)

- The supply voltage is defined relative to $V_{SS} = 0V$
- The supply voltages applied on VDD1, VDD2, and VDD3 should be derived from a common supply source.
- If the supply voltages on VDD1, VDD2, and VDD3 are from different sources, they should be applied simultaneously. The SM8706A may be damaged if the supply voltage timing is different.

1. When using an external clock input, the XTI duty should be 50% with 3.3V clock signal amplitude level. The input signal voltage should not exceed the absolute maximum rating, otherwise damage may occur.
2. The numeric values are measured values using the circuit in Figure 1 and the NPC standard evaluation board.
3. The numeric values are measured values obtained using the circuit in Figure 2 and the NPC standard evaluation board.
4. This is the time, after the supply is turned ON from the OFF state, until the output clock reaches $\pm 0.1\%$ of the specified frequency.

FUNCTIONAL DESCRIPTION

36.8640MHz Master Clock

The SM8706A 36.8640MHz master clock circuit is configured, as shown in Figure 3, with the crystal oscillator element connected between XTI (pin 7) and XTO (pin 8).

Alternatively, the 36.8640MHz master clock can be supplied from an external master clock input on XTI, as shown in Figure 4.

If an external input clock on XTI is used, it is recommended that the frequency be 36.8640MHz, with 50% duty, and 3.3V voltage amplitude level.

Furthermore, when using an external clock input, the input signal voltage should not exceed the absolute maximum rating, otherwise damage may occur.

Figure 4. External clock input

Sampling Frequency and Output Clock Frequency

The SM8706A sampling frequency f_s can be switched between 44.1kHz when FSEL (pin 14) is LOW, and 48kHz when FSEL is HIGH. The audio outputs (AO1 and AO2) are a 384 f_s and 768 f_s frequency clock, respectively, where f_s is determined by the setting on FSEL. In addition, the signal processor outputs (SO1 and SO2) are a 16.9344MHz and 33.8688MHz frequency clock, respectively, derived from the master clock. The video outputs (MO1 and MO2) are a 27MHz and 54MHz frequency clock, respectively, derived from the master clock.

When CE (Pin16) is HIGH, the chip is enabled. When LOW, the chip is disabled. When disabled, all output go LOW and all internal circuits stop operating. When CE goes LOW to HIGH, the chip moves from disabled to enabled, the time taken until the output frequency clocks stabilize is a maximum of 5ms.

The SM8706A output clock frequencies that can be selected is shown in Table 1. The output clock response timing relative to the CE setting is shown in Figure 5.

Sampling Frequency Switching Settling Time

The clock output response timing when the sampling frequency f_s is switched using FSEL is shown in Figure 6. The settling time t_s for the audio output clock when switching the sampling frequency is $1\mu s$ maximum.
