UVEPROM SMJ27C256

256K UVEPROM

UV Erasable Programmable
Read-Only Memory

AVAILABLE AS MILITARY SPECIFICATIONS

- SMD 5962-86063
- MIL-STD-883

FEATURES

- Organized 32,768 x 8
- Single +5V ±10% power supply
- Pin-compatible with existing 256K ROM's and EPROM's
- All inputs/outputs fully TTL compatible
- Power-saving CMOS technology
- Very high-speed SNAP! Pulse Programming
- 3-state output buffers
- 400-mV DC assured noise immunity with standard TTL loads
- Latchup immunity of 250 mA on all input and output pins
- Low power dissipation (CMOS Input Levels)
 - ✓ Active - 165mW Worst Case
 - ✓ Standby - 1.7mW Worst Case (CMOS-input levels)

GENERAL DESCRIPTION

The SMJ27C256 series is a set of 262,144 bit, ultraviolet-light erasable, electrically programmable read-only memories. These devices are fabricated using power-saving CMOS technology for high speed and simple interface with MOS and bipolar circuits. All inputs (including program data inputs) can be driven by Series 54 TTL circuits without the use of external pullup resistors. Each output can drive one Series 54 TTL circuit without external resistors. The data outputs are 3-state for connecting multiple devices to a common bus. The SMJ27C256 is pin-compatible with 28-pin 256K ROMs and EPROMs. It is offered in a 600mil dual-in-line ceramic package (J suffix) rated for operation from -55°C to 125°C.

Because this EPROM operates from a single 5V supply (in the read mode), it is ideal for use in microprocessor-based systems. One other supply (13V) is needed for programming. All programming signals are TTL level. This device is programmable by the SNAP! Pulse programming algorithm. The SNAP! Pulse programming algorithm uses a V_{PP} of 13V and a V_{CC} of 6.5V for a nominal programming time of four seconds. For programming outside the system, existing EPROM programmers can be used. Locations can be programmed singly, in blocks, or at random.

FUNCTIONAL BLOCK DIAGRAM*

* This symbol is in accordance with ANSI/IEEE std 91-1984 and IEC Publication 617-12.

OPERATION

The seven modes of operation for the SMJ27C256 are listed in Table 1. The read mode requires a single 5V supply. All inputs are TTL level except for V_{PP} during programming (13V for SNAP! Pulse), and (12V) on A9 for signature mode.

READ/OUTPUT DISABLE

When the outputs of two or more SMJ27C256s are connected in parallel on the same bus, the output of any particular device in the circuit can be read with no interference from the competing outputs of the other devices. To read the output of the selected SMJ27C256, a low-level signal is applied to $E\backslash$ and $G\backslash$. All other devices in the circuit should have their outputs disabled by applying a high-level signal to one of these pins. Output data is accessed at pins DQ0 through DQ7.

LATCHUP IMMUNITY

Latchup immunity on the SMJ27C256 is a minimum of 250mA on all inputs and outputs. This feature provides latchup immunity beyond any potential transients at the printed circuit board level when the EPROM is interfaced to industry standard TTL or MOS logic devices. Input/output layout approach controls latchup without compromising performance or packing density.

POWER DOWN

Active I_{CC} supply current can be reduced from 25mA (SMJ27C256-15 through SMJ27C256-25) to 500 μ A (TTL-level inputs) or 300 μ A (CMOS-level inputs) by applying a high TTL/CMOS signal to the $E\backslash$ pin. In this mode all outputs are in the high-impedance state.

ERASURE

Before programming, the SMJ27C256 is erased by exposing the chip through the transparent lid to a high-intensity ultraviolet light (wavelength 2537 Å). EPROM erasure before programming is necessary to ensure that all bits are in the logic-high state. Logic-lows are programmed into the desired locations. A programmed logic-low can be erased only by ultraviolet light. The recommended minimum exposure dose (UV intensity x exposure time) is 15W•s/cm². A typical 12mW/cm², filterless UV lamp erases the device in 21 minutes. The lamp should be located about 2.5cm above the chip during erasure. After erasure, all bits are in the high state. It should be noted that normal ambient light contains the correct wavelength for erasure; therefore, when using the SMJ27C256, the window should be covered with an opaque label.

SNAP! PULSE PROGRAMMING

The SMJ27C256 EPROM is programmed by using the SNAP! Pulse programming algorithm as illustrated by the flowchart in Figure 1. This algorithm programs the device in a nominal time of 4 seconds. Actual programming time varies as a function of the programmer used.

Data is presented in parallel (eight bits) on pins DQ0 to DQ7. Once addresses and data are stable, $E\backslash$ is pulsed.

The SNAP! Pulse programming algorithm uses initial pulses of 100 microseconds (μ s) followed by a byte-verification step to determine when the addressed byte has been successfully programmed. Up to ten 100 μ s pulses per byte are provided before a failure is recognized.

The programming mode is achieved when $V_{PP} = 13V$, $V_{CC} = 6.5V$, $G\backslash = V_{IH}$, and $E\backslash = V_{IL}$. More than one device can be programmed when the devices are connected in parallel. Locations can be programmed in any order. When the SNAP! Pulse programming routine is completed, all bits are verified with $V_{CC} = V_{PP} = 5V$.

PROGRAM INHIBIT

Programming can be inhibited by maintaining a high-level input on $E\backslash$.

PROGRAM VERIFY

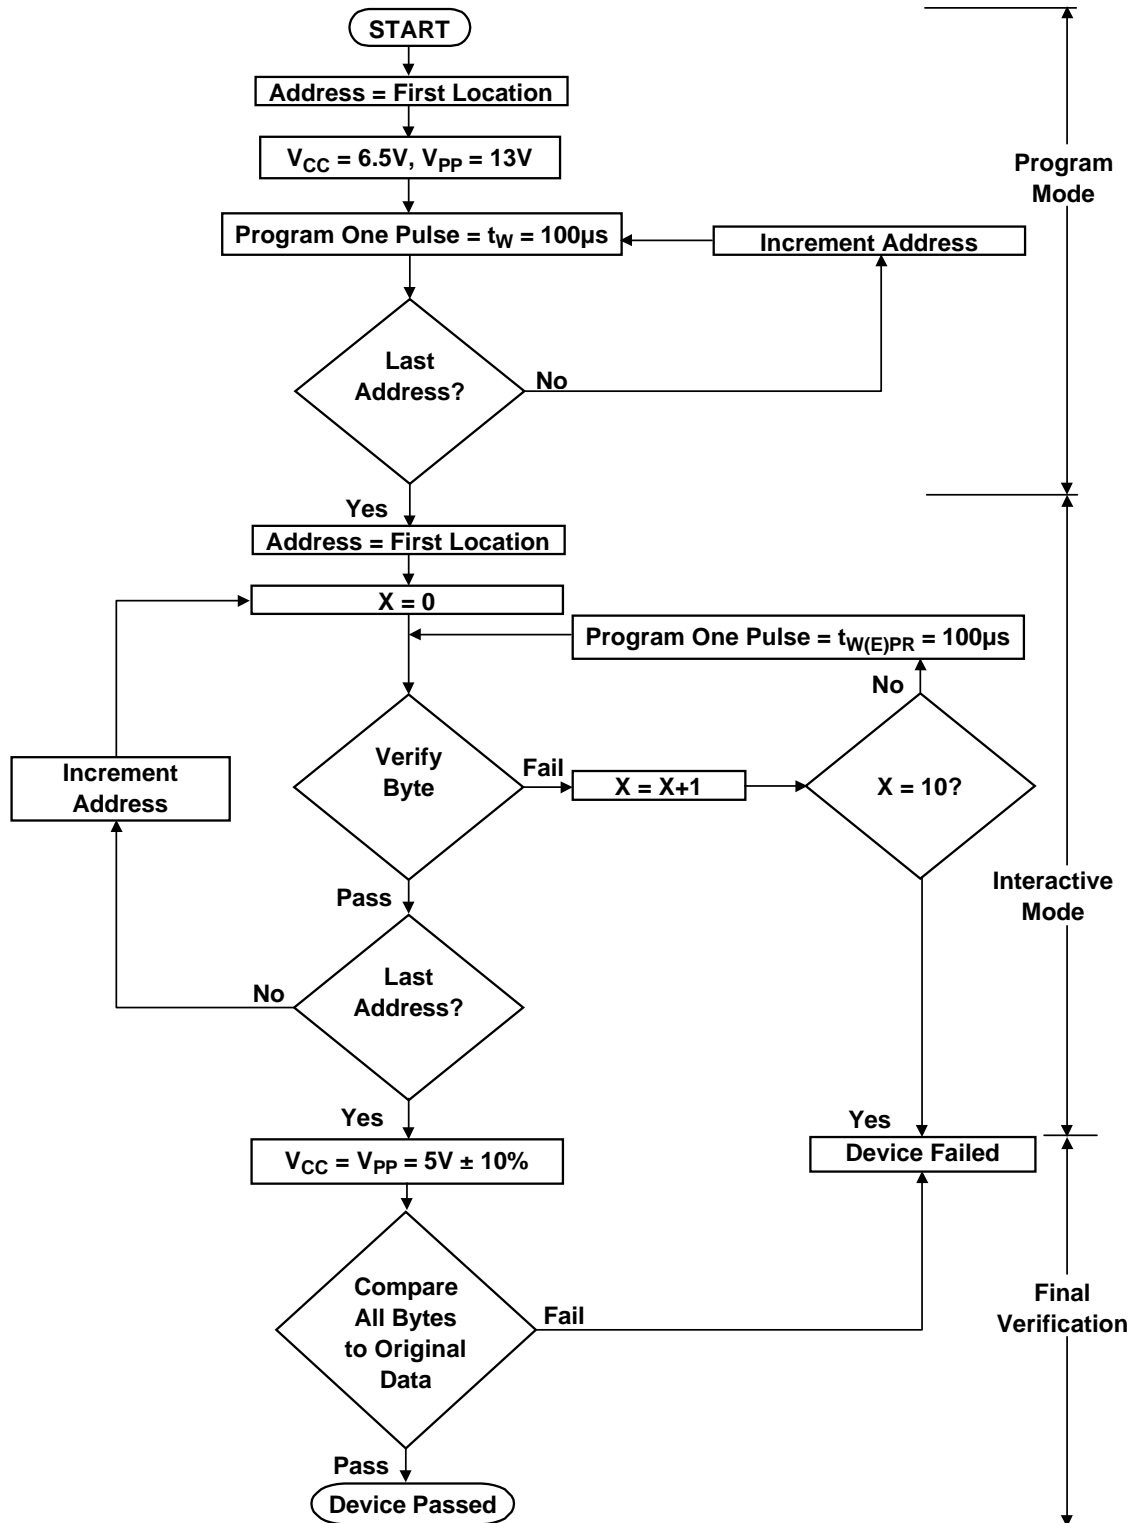

Programmed bits can be verified with $V_{PP} = 13V$ when $G\backslash = V_{IL}$, and $E\backslash = V_{IH}$.

SIGNATURE MODE

The signature mode provides access to a binary code identifying the manufacturer and device type. This mode is activated when A9 is forced to 12V \pm 0.5V. Two identifier bytes are accessed by A0 (terminal 10); i.e., $A0 = V_{IL}$ accesses the manufacturer code, which is output on DQ0-DQ7; $A0 = V_{IH}$ accesses the device code, which is also output on DQ0-DQ7. All other addresses must be held at VIL. Each byte contains odd parity on bit DQ7. The manufacturer code for these devices is 97h and the device code is 04h.

*Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operation section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

NOTES:

1. V_{CC} must be applied before or at the same time as V_{PP} and removed after or at the same time as V_{PP} . The device must not be inserted into or removed from the board when V_{PP} or V_{CC} is applied.

2. V_{PP} can be connected to V_{CC} directly (except in the program mode). V_{CC} supply current in this case would be $I_{CC2} + I_{PP1}$.
