SN74LS156

Dual 1-of-4 Decoder/ Demultiplexer

The SN74LS156 is a high speed Dual 1-of-4 Decoder/ Demultiplexer. This device has two decoders with common 2-bit Address inputs and separate gated Enable inputs. Decoder “a” has an Enable gate with one active HIGH and one active LOW input. Decoder “b” has two active LOW Enable inputs. If the Enable functions are satisfied, one output of each decoder will be LOW as selected by the address inputs. The LS156 has open collector outputs for wired-OR (DOT-AND) decoding and function generator applications.

The LS156 is fabricated with the Schottky barrier diode process for high speed and are completely compatible with all ON Semiconductor TTL families.

- Schottky Process for High Speed
- Multifunction Capability
- Common Address Inputs
- True or Complement Data Demultiplexing
- Input Clamp Diodes Limit High Speed Termination Effects
- ESD > 3500 Volts

GUARANTEED OPERATING RANGES

FUNCTIONAL DESCRIPTION

The LS156 is a Dual 1-of-4 Decoder/Demultiplexer with common Address inputs and separate gated Enable inputs. When enabled, each decoder section accepts the binary weighted Address inputs (A_0, A_1) and provides four mutually exclusive active LOW outputs (O_0–O_3). If the Enable requirements of each decoder are not met, all outputs of that decoder are HIGH.

Each decoder section has a 2-input enable gate. The enable gate for Decoder "a" requires one active HIGH input and one active LOW input ($E_a \bullet \overline{E_a}$). In demultiplexing applications, Decoder "a" can accept either true or complemented data by using the E_a or $\overline{E_a}$ inputs respectively. The enable gate for Decoder "b" requires two active LOW inputs ($\overline{E_b} \bullet \overline{E_b}$). The LS155 or LS156 can be used as a 1-of-8 Decoder/Demultiplexer by tying E_a to E_b and relabeling the common connection as (A_2). The other E_b and E_a are connected together to form the common enable.

The LS156 can be used to generate all four minterms of two variables. These four minterms are useful in some applications replacing multiple gate functions as shown in Fig. a. The LS156 has the further advantage of being able to AND the minterm functions by tying outputs together. Any number of terms can be wired-AND as shown below.

$f = (E + A_0 + A_1) \cdot (E + \overline{A_0} + A_1) \cdot (E + A_0 + \overline{A_1}) \cdot (E + A_0 + A_1)$

where $E = E_a + \overline{E_a}$; $E = E_b + E_b$
