

# STK10C48

## 2K x 8 nvSRAM

### QuantumTrap™ CMOS

### Nonvolatile Static RAM

#### FEATURES

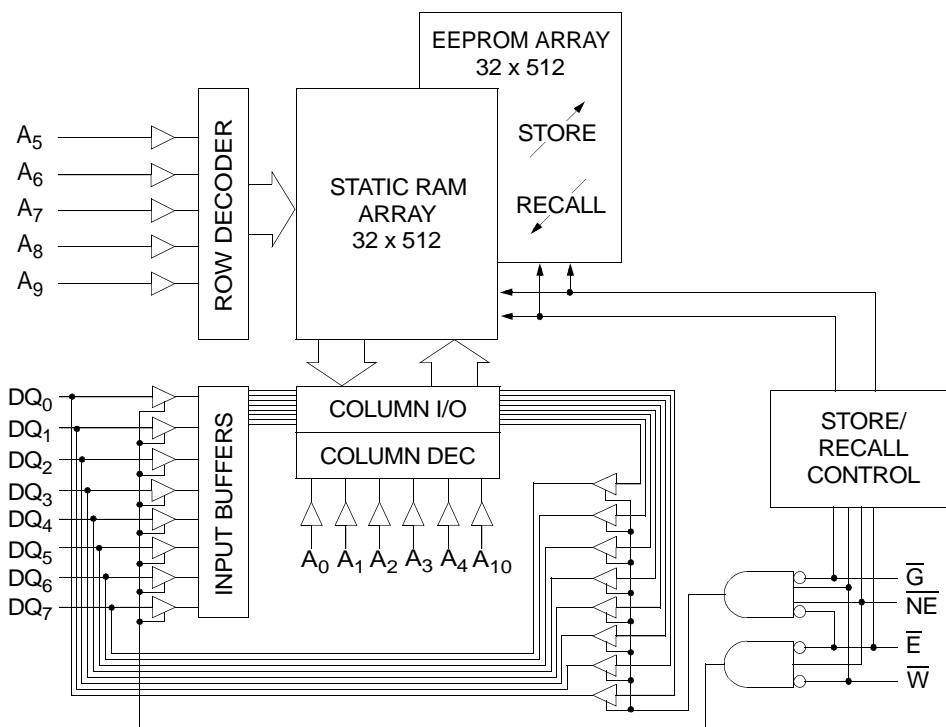

- 20ns, 25ns, 35ns and 45ns Access Times
- *STORE* to EEPROM Initiated by Hardware
- *RECALL* to SRAM Initiated by Hardware or Power Restore
- Automatic *STORE* Timing
- 10mA Typical  $I_{CC}$  at 200ns Cycle Time
- Unlimited *READ*, *WRITE* and *RECALL* Cycles
- 1,000,000 *STORE* Cycles to EEPROM
- 100-Year Data Retention over Full Industrial Temperature Range
- Commercial and Industrial Temperatures
- 28-Pin 300 mil PDIP, 300 mil SOIC and 350 mil SOIC Packages

#### DESCRIPTION

The Simtek STK10C48 is a fast static RAM with a non-volatile electrically erasable PROM (EEPROM) element incorporated in each static memory cell. The SRAM can be read and written an unlimited number of times, while independent nonvolatile data resides in EEPROM. Data may easily be transferred from the SRAM to the EEPROM (the *STORE* operation), or from the EEPROM to the SRAM (the *RECALL* operation), using the  $\overline{NE}$  pin. Transfers from the EEPROM to the SRAM (the *RECALL* operation) also take place automatically on restoration of power. The STK10C48 combines the high performance and ease of use of a fast SRAM with nonvolatile data integrity.

The STK10C48 features industry-standard pinout for nonvolatile RAMs.

#### BLOCK DIAGRAM

#### PIN CONFIGURATIONS

$\overline{NE}$	1	28	$V_{CC}$
NC	2	27	$\overline{W}$
$A_7$	3	26	NC
$A_6$	4	25	$A_8$
$A_5$	5	24	$A_9$
$A_4$	6	23	NC
$A_3$	7	22	G
$A_2$	8	21	$A_{10}$
$A_1$	9	20	$\overline{E}$
$A_0$	10	19	DQ <sub>7</sub>
DQ <sub>0</sub>	11	18	DQ <sub>6</sub>
DQ <sub>1</sub>	12	17	DQ <sub>5</sub>
DQ <sub>2</sub>	13	16	DQ <sub>4</sub>
$V_{SS}$	14	15	DQ <sub>3</sub>

28 - 300 PDIP  
28 - 300 SOIC  
28 - 350 SOIC

#### PIN NAMES

Pin Name	Description
$A_0 - A_{10}$	Address Inputs
$\overline{W}$	Write Enable
DQ <sub>0</sub> - DQ <sub>7</sub>	Data In/Out
$\overline{E}$	Chip Enable
G	Output Enable
$\overline{NE}$	Nonvolatile Enable
$V_{CC}$	Power (+ 5V)
$V_{SS}$	Ground

**ABSOLUTE MAXIMUM RATINGS<sup>a</sup>**

Voltage on Input Relative to  $V_{SS}$  . . . . .  $-0.6V$  to  $(V_{CC} + 0.5V)$   
 Voltage on  $DQ_{0-7}$  . . . . .  $-0.5V$  to  $(V_{CC} + 0.5V)$   
 Temperature under Bias . . . . .  $-55^{\circ}C$  to  $125^{\circ}C$   
 Storage Temperature . . . . .  $-65^{\circ}C$  to  $150^{\circ}C$   
 Power Dissipation . . . . .  $1W$   
 DC Output Current (1 output at a time, 1s duration) . . . . .  $15mA$

Note a: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

**DC CHARACTERISTICS**

$(V_{CC} = 5.0V \pm 10\%)^b$

SYMBOL	PARAMETER	COMMERCIAL		INDUSTRIAL		UNITS	NOTES
		MIN	MAX	MIN	MAX		
$I_{CC1}^c$	Average $V_{CC}$ Current		95		N/A	mA	$t_{AVAV} = 20ns$ $t_{AVAV} = 25ns$ $t_{AVAV} = 35ns$ $t_{AVAV} = 45ns$
			85		90	mA	
			75		75	mA	
			65		65	mA	
$I_{CC2}^d$	Average $V_{CC}$ Current during <i>STORE</i>		3		3	mA	All Inputs Don't Care, $V_{CC} = max$
$I_{CC3}^c$	Average $V_{CC}$ Current at $t_{AVAV} = 200ns$ 5V, $25^{\circ}C$ , Typical		10		10	mA	$\overline{W} \geq (V_{CC} - 0.2V)$ All Others Cycling, CMOS Levels
$I_{SB1}^e$	Average $V_{CC}$ Current (Standby, Cycling TTL Input Levels)		30		N/A	mA	$t_{AVAV} = 20ns, \overline{E} \geq V_{IH}$ $t_{AVAV} = 25ns, \overline{E} \geq V_{IH}$ $t_{AVAV} = 35ns, \overline{E} \geq V_{IH}$ $t_{AVAV} = 45ns, \overline{E} \geq V_{IH}$
			25		26	mA	
			21		22	mA	
			18		19	mA	
$I_{SB2}^e$	$V_{CC}$ Standby Current (Standby, Stable CMOS Input Levels)		750		750	$\mu A$	$\overline{E} \geq (V_{CC} - 0.2V)$ All Others $V_{IN} \leq 0.2V$ or $\geq (V_{CC} - 0.2V)$
$I_{ILK}$	Input Leakage Current		$\pm 1$		$\pm 1$	$\mu A$	$V_{CC} = max$ $V_{IN} = V_{SS}$ to $V_{CC}$
$I_{OLK}$	Off-State Output Leakage Current		$\pm 5$		$\pm 5$	$\mu A$	$V_{CC} = max$ $V_{IN} = V_{SS}$ to $V_{CC}$ , $\overline{E}$ or $\overline{G} \geq V_{IH}$
$V_{IH}$	Input Logic "1" Voltage	2.2	$V_{CC} + .5$	2.2	$V_{CC} + .5$	V	All Inputs
$V_{IL}$	Input Logic "0" Voltage	$V_{SS} - .5$	0.8	$V_{SS} - .5$	0.8	V	All Inputs
$V_{OH}$	Output Logic "1" Voltage	2.4		2.4		V	$I_{OUT} = -4mA$
$V_{OL}$	Output Logic "0" Voltage		0.4		0.4	V	$I_{OUT} = 8mA$
$T_A$	Operating Temperature	0	70	-40	85	$^{\circ}C$	

Note b: The STK10C48-20 requires  $V_{CC} = 5.0V \pm 5\%$  supply to operate at specified speed.  
 Note c:  $I_{CC1}$  and  $I_{CC3}$  are dependent on output loading and cycle rate. The specified values are obtained with outputs unloaded.  
 Note d:  $I_{CC1}$  is the average current required for the duration of the *STORE* cycle ( $t_{STORE}$ ).  
 Note e:  $\overline{E} \geq V_{IH}$  will not produce standby current levels until any nonvolatile cycle in progress has timed out.

**AC TEST CONDITIONS**

Input Pulse Levels . . . . .  $0V$  to  $3V$   
 Input Rise and Fall Times . . . . .  $\leq 5ns$   
 Input and Output Timing Reference Levels . . . . .  $1.5V$   
 Output Load . . . . . See Figure 1

**CAPACITANCE<sup>f</sup>** ( $T_A = 25^{\circ}C, f = 1.0MHz$ )

SYMBOL	PARAMETER	MAX	UNITS	CONDITIONS
$C_{IN}$	Input Capacitance	8	pF	$\Delta V = 0$ to $3V$
$C_{OUT}$	Output Capacitance	7	pF	$\Delta V = 0$ to $3V$

Note f: These parameters are guaranteed but not tested.

RECALL CYCLE #2:  $\overline{E}$  Controlled<sup>o</sup>

RECALL CYCLE #3:  $\overline{G}$  Controlled<sup>o, r</sup>

## DEVICE OPERATION

The STK10C48 has two modes of operation: SRAM mode and nonvolatile mode, determined by the state of the  $\overline{NE}$  pin. When in SRAM mode, the memory operates as a standard fast static RAM. While in nonvolatile mode, data is transferred in parallel from SRAM to EEPROM or from EEPROM to SRAM.

### NOISE CONSIDERATIONS

Note that the STK10C48 is a high-speed memory and so must have a high-frequency bypass capacitor of approximately  $0.1\mu\text{F}$  connected between  $V_{CC}$  and  $V_{SS}$ , using leads and traces that are as short as possible. As with all high-speed CMOS ICs, normal careful routing of power, ground and signals will help prevent noise problems.

### SRAM READ

The STK10C48 performs a READ cycle whenever  $\overline{E}$  and  $\overline{G}$  are low and  $\overline{NE}$  and  $\overline{W}$  are high. The address specified on pins  $A_{0-10}$  determines which of the 2,048 data bytes will be accessed. When the READ is initiated by an address transition, the outputs will be valid after a delay of  $t_{AVQV}$  (READ cycle #1). If the READ is initiated by  $\overline{E}$  or  $\overline{G}$ , the outputs will be valid at  $t_{ELQV}$  or at  $t_{GLQV}$ , whichever is later (READ cycle #2). The data outputs will repeatedly respond to address changes within the  $t_{AVQV}$  access time without the need for transitions on any control input pins, and will remain valid until another address change or until  $\overline{E}$  or  $\overline{G}$  is brought high or  $\overline{W}$  or  $\overline{NE}$  is brought low.

### SRAM WRITE

A WRITE cycle is performed whenever  $\overline{E}$  and  $\overline{W}$  are low and  $\overline{NE}$  is high. The address inputs must be stable prior to entering the WRITE cycle and must remain stable until either  $\overline{E}$  or  $\overline{W}$  goes high at the end of the cycle. The data on pins  $DQ_{0-7}$  will be written into the memory if it is valid  $t_{DVWH}$  before the end of a  $\overline{W}$  controlled WRITE or  $t_{DVEH}$  before the end of an  $\overline{E}$  controlled WRITE.

It is recommended that  $\overline{G}$  be kept high during the entire WRITE cycle to avoid data bus contention on the common I/O lines. If  $\overline{G}$  is left low, internal circuitry will turn off the output buffers  $t_{WLQZ}$  after  $\overline{W}$  goes low.

### NONVOLATILE STORE

A STORE cycle is performed when  $\overline{NE}$ ,  $\overline{E}$  and  $\overline{W}$  and low and  $\overline{G}$  is high. While any sequence that achieves this state will initiate a STORE, only  $\overline{W}$  initiation (STORE cycle #1) and  $\overline{E}$  initiation (STORE cycle #2) are practical without risking an unintentional SRAM WRITE that would disturb SRAM data. During a STORE cycle, previous nonvolatile data is erased and the SRAM contents are then programmed into nonvolatile elements. Once a STORE cycle is initiated, further input and output are disabled and the  $DQ_{0-7}$  pins are tri-stated until the cycle is complete.

If  $\overline{E}$  and  $\overline{G}$  are low and  $\overline{W}$  and  $\overline{NE}$  are high at the end of the cycle, a READ will be performed and the outputs will go active, signaling the end of the STORE.

### NONVOLATILE RECALL

A RECALL cycle is performed when  $\overline{E}$ ,  $\overline{G}$  and  $\overline{NE}$  are low and  $\overline{W}$  is high. Like the STORE cycle, RECALL is initiated when the last of the four clock signals goes to the RECALL state. Once initiated, the RECALL cycle will take  $t_{NLQX}$  to complete, during which all inputs are ignored. When the RECALL completes, any READ or WRITE state on the input pins will take effect.

Internally, RECALL is a two-step procedure. First, the SRAM data is cleared, and second, the nonvolatile information is transferred into the SRAM cells. The RECALL operation in no way alters the data in the nonvolatile cells. The nonvolatile data can be recalled an unlimited number of times.

As with the STORE cycle, a transition must occur on any one control pin to cause a RECALL, preventing inadvertent multi-triggering. On power up, once  $V_{CC}$  exceeds 4.25V, a RECALL cycle is automatically initiated. Due to this automatic RECALL, SRAM operation cannot commence until  $t_{RESTORE}$  after  $V_{CC}$  exceeds 4.25V.

### POWER-UP RECALL

During power up, or after any low-power condition ( $V_{CC} < 3.0\text{V}$ ), an internal RECALL request will be latched. When  $V_{CC}$  once again exceeds 4.25V, a RECALL cycle will automatically be initiated and will take  $t_{RESTORE}$  to complete.

If the STK10C48 is in a WRITE state at the end of power-up *RECALL*, the SRAM data will be corrupted. To help avoid this situation, a 10K Ohm resistor should be connected either between  $\overline{W}$  and system  $V_{CC}$  or between  $\overline{E}$  and system  $V_{CC}$ .

**HARDWARE PROTECT**

The STK10C48 offers two levels of protection to suppress inadvertent *STORE* cycles. If the control signals ( $\overline{E}$ ,  $\overline{G}$ ,  $\overline{W}$  and  $\overline{NE}$ ) remain in the *STORE* condition at the end of a *STORE* cycle, a second *STORE* cycle will not be started. The *STORE* (or *RECALL*) will be initiated only after a transition on any one of these signals to the required state. In addition to multi-trigger protection, *STORES* are inhibited when  $V_{CC}$  is below 4.0V, protecting against inadvertent *STORES*.

**LOW AVERAGE ACTIVE POWER**

The STK10C48 draws significantly less current when it is cycled at times longer than 55ns. Figure 2 shows the relationship between  $I_{CC}$  and READ cycle time. Worst-case current consumption is shown for both CMOS and TTL input levels (commercial temperature range,  $V_{CC} = 5.5V$ , 100% duty cycle on chip enable). Figure 3 shows the same relationship for WRITE cycles. If the chip enable duty cycle is less than 100%, only standby current is drawn when the chip is disabled. The overall average current drawn by the STK10C48 depends on the following items: 1) CMOS vs. TTL input levels; 2) the duty cycle of chip enable; 3) the overall cycle rate for accesses; 4) the ratio of READS to WRITES; 5) the operating temperature; 6) the  $V_{CC}$  level; and 7) I/O loading.
