DATA SHEET

An ON Semiconductor Company

STK672-532 — Thick-Film Hybrid IC 2-phase Stepping Motor Driver

Overview

The STK672-532 is a hybrid IC for use as a unipolar, 2-phase stepping motor driver with PWM current control.

Applications

- Office photocopiers, printers, etc.

Features

- The motor speed can be controlled by the frequency of an external clock signal.
- 2-phase excitation or 1-2 phase excitation is selected according to switching the state of the MODE pin (low or high).
- The phase is maintained even if the excitation mode is switched in the middle of operation.
- The direction of rotation can be changed by applying a high or low signal to the CWB pin used to select the direction of rotation.
- Supports schmitt input for 2.5V high level input.
- Incorporating a current detection resistor (0.165Ω: resistor tolerance ±2%), motor current can be set using two external resistors.
- Equipped with an ENABLE pin that, during clock input, allows motor output to be cut-off and resumed later while maintaining the same excitation timing.

■ Any and all SANYO Semiconductor Co.,Ltd. products described or contained herein are, with regard to "standard application", intended for the use as general electronics equipment. The products mentioned herein shall not be intended for use for any "special application" (medical equipment whose purpose is to sustain life, aerospace instrument, nuclear control device, burning appliances, transportation machine, traffic signal system, safety equipment etc.) that shall require extremely high level of reliability and can directly threaten human lives in case of failure or malfunction of the product or may cause harm to human bodies, nor shall they grant any guarantee thereof. If you should intend to use our products for new introduction or other application different from current conditions on the usage of automotive device, communication device, office equipment, industrial equipment etc. , please consult with us about usage condition (temperature, operation time etc.) prior to the intended use. If there is no consultation or inquiry before the intended use, our customer shall be solely responsible for the use.

■ Specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.

SANYO Semiconductor Co., Ltd.

Specifications

Absolute Maximum Ratings at $T_c = 25^\circ\text{C}$

| Parameter | Symbol | Conditions | Ratings | unit |
|---------------------------------|--------------|--|--------------|------------------|
| Maximum supply voltage 1 | V_{CC} max | No signal | 52 | V |
| Maximum supply voltage 2 | V_{DD} max | No signal | -0.3 to +7.0 | V |
| Input voltage | V_{IN} max | Logic input pins | -0.3 to +7.0 | V |
| Output current 1 | I_{OP} max | 10 μ A 1 pulse (resistance load) | 5 | A |
| Output current 2 | I_{OH} max | $V_{DD}=5\text{V}$, $\text{CLOCK}\geq 200\text{Hz}$ | 2.65 | A |
| Allowable power dissipation | P_d max | With an arbitrarily large heat sink. Per MOSFET | 10.2 | W |
| Operating substrate temperature | T_c max | | 105 | $^\circ\text{C}$ |
| Junction temperature | T_j max | | 150 | $^\circ\text{C}$ |
| Storage temperature | T_{stg} | | -40 to +125 | $^\circ\text{C}$ |

Allowable Operating Ranges at $T_a=25^\circ\text{C}$

| Parameter | Symbol | Conditions | Ratings | unit |
|---|-----------|---|-----------------|------------------|
| Operating supply voltage 1 | V_{CC} | With signals applied | 10 to 42 | V |
| Operating supply voltage 2 | V_{DD} | With signals applied | 5 \pm 5% | V |
| Input high voltage | V_{IH} | Pins 8, 9, 10, 11, 12 | 2.5 to V_{DD} | V |
| Input low voltage | V_{IL} | Pins 8, 9, 10, 11, 12 | 0 to 0.6 | V |
| Output current 1 | I_{OH1} | $T_c=105^\circ\text{C}$, $\text{CLOCK}\geq 200\text{Hz}$, Continuous operation, duty=100% | 2.0 | A |
| Output current 2 | I_{OH2} | $T_c=80^\circ\text{C}$, $\text{CLOCK}\geq 200\text{Hz}$, Continuous operation, duty=100%, See the motor current (I_{OH}) derating curve | 2.2 | A |
| CLOCK frequency | f_{CL} | Minimum pulse width: at least 10 μ s | 0 to 50 | kHz |
| Phase driver withstand voltage | V_{DSS} | $I_D=1\text{mA}$ ($T_c=25^\circ\text{C}$) | 100min | V |
| Recommended operating substrate temperature | T_c | No condensation | 0 to 105 | $^\circ\text{C}$ |
| Recommended Vref range | Vref | $T_c=105^\circ\text{C}$ | 0.14 to 1.62 | V |

Refer to the graph for each conduction-period tolerance range for the output current and brake current.

Electrical Characteristics at $T_c=25^\circ\text{C}$, $V_{CC}=24\text{V}$, $V_{DD}=5.0\text{V}$

| Parameter | Symbol | Conditions | min | typ | max | unit |
|---------------------------|------------|--|-------|------|----------|---------------|
| V_{DD} supply current | I_{CCO} | Pin 6 current $\text{CLOCK}=\text{GND}$ | | 3.1 | 7 | mA |
| Output average current | I_{oave} | $R/L=3\Omega/3.8\text{mH}$ in each phase | 0.324 | 0.36 | 0.396 | A |
| FET diode forward voltage | Vdf | $I_f=1\text{A}$ ($R_L=23\Omega$) | | 1.0 | 1.6 | V |
| Output saturation voltage | V_{sat} | $R_L=23\Omega$ | | 0.45 | 0.64 | V |
| Input high voltage | V_{IH} | Pins 8, 9, 10, 11, 12 | 2.5 | | | V |
| Input low voltage | V_{IL} | Pins 8, 9, 10, 11, 12 | | | 0.6 | V |
| Input leak current | I_{IL} | Pins 8, 9, 10, 11, 12= GND and 5V | | | ± 10 | μA |
| Vref input bias current | I_{IB} | Pin 7 =1.0V | | 204 | 216 | μA |
| PWM frequency | fc | | 35 | 45 | 55 | kHz |

Notes: A fixed-voltage power supply must be used.

Package Dimensions

unit:mm (typ)

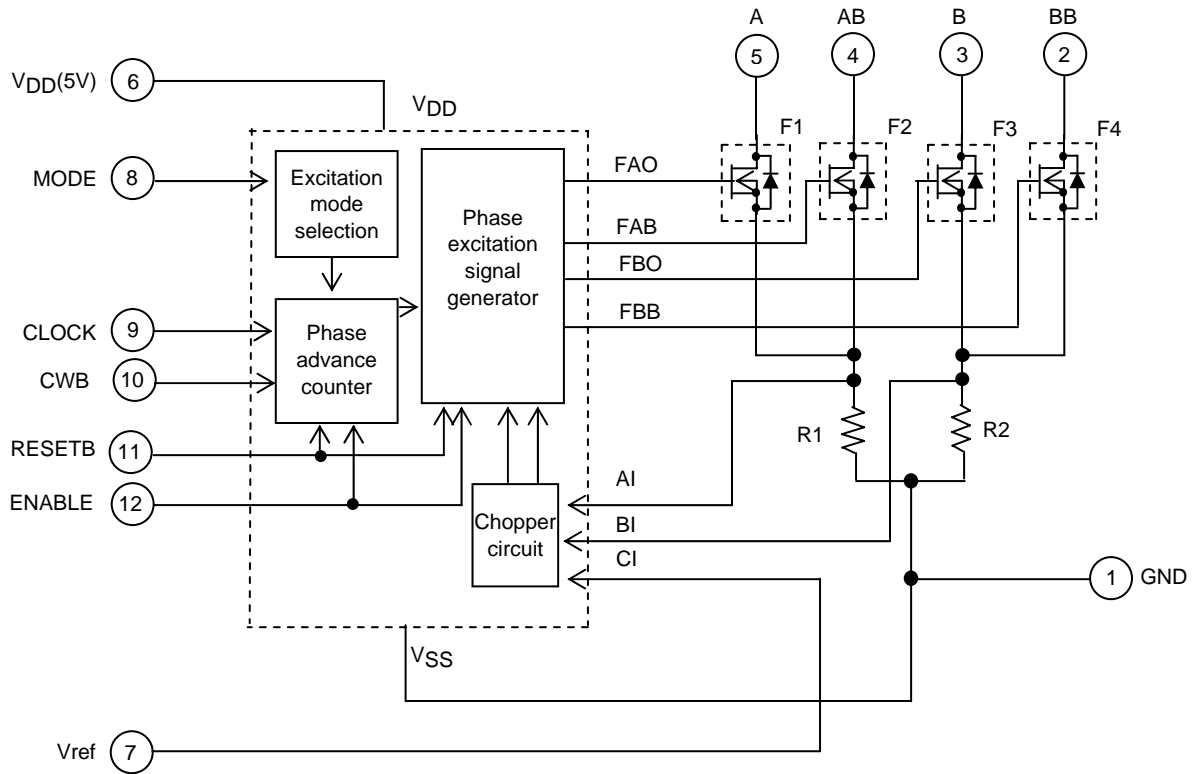

Derating Curve of Motor Current, I_{OH} , vs. STK672-532 Operating Substrate Temperature, T_c

Notes

- The current range given above represents conditions when output voltage is not in the avalanche state.
- If the output voltage is in the avalanche state, see the allowable avalanche energy for STK672-5** series hybrid ICs given in a separate document.
- The operating substrate temperature, T_c , given above is measured while the motor is operating. Because T_c varies depending on the ambient temperature, T_a , the value of I_{OH} , and the continuous or intermittent operation of I_{OH} , always verify this value using an actual set.

Block Diagram

Sample Application Circuit

R02 is normally open.

Precautions

[GND wiring]

- To reduce noise on the 5V system, be sure to place the GND of C01 in the circuit given above as close as possible to Pin 1 of the hybrid IC. Also, the GND side of RO2 must be directly wired from P.GND terminal Pin 1 in order to accurately set the current.

[Input pins]

- Insert resistor RO3 (47 to 100Ω) so that the discharge energy from capacitor CO2 is not directly applied to the CMOS IC in this hybrid device. If the diode D1 has Vf characteristics with Vf less than or equal to 0.6V (when If = 0.1A), this will be smaller than the CMOS IC input pin diode Vf. If this is the case RO3 may be replaced with a short without problem.
- Apply 2.5V High level input to pins 8, 9, 10, 11, and 12.
- If VDD is being applied, use care that each input pin does not apply a negative voltage less than -0.3V to P.GND, Pin 1, and do not apply a voltage greater than or equal to VDD voltage.
- Since the input pins do not have built-in pull-up resistors, when the open-collector type pins 8, 9, 10, 11, and 12 are used as inputs, a 10 to 47kΩ pull-up resistor (to VDD) must be used.
At this time, use a device for the open collector driver that has output current specifications that pull the voltage down to less than 0.6V at Low level.
- To prevent incorrect operation due to chopping noise, insert 1000pF capacitors between each of the input pins (pins 8, 9, 10, 11 and 12) and pin 1. These capacitors must be mounted as close as possible to the hybrid IC.
Inputs that will be held fixed at the low level should be connected directly to pin 1.
Inputs that will be held fixed at the high level should be connected directly to the 5V power supply line.

[Current setting Vref]

- In consideration of the specifications of the Vref input bias current, IIB, a resistance from several kΩ to 100kΩ is recommended for RO1.
- If the motor current is temporarily reduced, the circuit given below (STK672-532: IOH>0.17A) is recommended.
- Although the driver is equipped with a fixed current control function, it is not equipped with an overcurrent protection function to ensure that the current does not exceed the maximum output current, IOH max. If Vref is mistakenly set to a voltage that exceeds IOH max, the driver will be damaged by overcurrent.

• Motor current peak value I_{OH} setting

• When RO2 is open

$$I_{OH} = [V_{ref} \times 1k / (1k + 3.9k)] \div R_s = (V_{ref} \div 4.9) \div R_s$$

The values 1k and 3.9k represent internal driver resistance values, while R_s represents the internal driver current detection resistance.

$$V_{ref} = (4.9k \div (4.9k + RO1)) \times 5V \text{ (or } 3.3V) = I_{OH} \times 4.9 \times R_s$$

The value 4.9k represents the series resistance value of the internal driver values of 1k and 3.9k.

• If RO2 is connected

$$I_{OH} = [V_{ref} \times 1k / (1k + 3.9k)] \div R_s = (V_{ref} \div 4.9) \div R_s$$

The values 1k and 3.9k represent the internal driver resistance values, while R_s represents the internal driver current detection resistance.

$$V_{ref} = (ROx \div (RO1 + ROx)) \times 5V \text{ (or } 3.3V) = I_{OH} \times 4.9 \times R_s$$

$$= [(4.9k \times RO2) \div ((4.9k \times RO2) + RO1 \times (4.9k + RO2))] \times 5V \text{ (or } 3.3V)$$

$$ROx = (4.9k \times RO2) \div (4.9k + RO2)$$

R_s represents the current detection resistance inside the HIC, while the value 4.9k in the formula above represents the internal resistance value of the V_{ref} pin.

$$R_s = 0.11\Omega \text{ when using the STK672-540}$$

$$R_s = 0.165\Omega \text{ when using the STK672-532}$$

$$R_s = 0.33\Omega \text{ when using the STK672-520}$$

[Smoke Emission Precautions]

If any of the output pins 2, 3, 4, and 5 is held open, the electrical stress onto the driver due to the inductive energy accumulated in the motor could cause short-circuit followed by permanent damage to the internal MOSFET. As a result, the STK672-532 may give rise to emit smoke.

Input Pin Functions

| Pin Name | Pin No. | Function | Input Conditions When Operating |
|----------|---------|--|---|
| CLOCK | 9 | Reference clock for motor phase current switching | Operates on the rising edge of the signal |
| MODE | 8 | Excitation mode selection | Low: 2-phase excitation High: 1-2 phase excitation |
| CWB | 10 | Motor direction switching | Low: CW (forward) High: CCW (reverse) |
| RESETB | 11 | System reset and A, AB, B, and BB outputs cutoff. Applications must apply a reset signal for at least 10μs when V_{DD} is first applied. | A reset is applied by a low level |
| ENABLE | 12 | The A, AB, B, and BB outputs are turned off, and after operation is restored by returning the ENABLE pin to the high level, operation continues with the same excitation timing as before the low-level input. | The A, AB, B, and BB outputs are turned off by a low-level input. |

- (1) A simple reset function is formed from D1, CO2, RO3, and RO4 in this application circuit. With the CLOCK input held low, when the 5V supply voltage is brought up a reset is applied if the motor output phases A and BB are driven. If the 5V supply voltage rise time is slow (over 50ms), the motor output phases A and BB may not be driven. Increase the value of the capacitor CO2 and check circuit operation again.
- (2) See the timing chart for the concrete details on circuit operation.

Usage Notes

1. STK672-520, STK672-532 and STK672-540 input signal functions and timing
(All inputs have no internal pull-up resistor.)

[RESETB and CLOCK (Input signal timing when power is first applied)]

As shown in the timing chart, a RESETB signal input is required by the driver to operate with the timing in which the F1 gate is turned on first. The RESETB signal timing must be set up to have a width of at least 10 μ s, as shown below. The capacitor CO2, and the resistors RO3 and RO4 in the application circuit form simple reset circuit that uses the RC time constant rising time. However, when designing the RESETB input based on V_{IH} levels, the application must have the timing shown in figure.

Figure 1 RESETB and CLOCK Signals Input Timing

[CLOCK (Phase switching clock)]

- Input frequency: DC to 50kHz
- Minimum pulse width: 10 μ s
- Signals are read on the rising edge.

[CWB (Motor direction setting)]

The direction of rotation is switched by setting CWB to 1 (high) or 0 (low).
See the timing charts for details on the operation of the outputs.

Note: The state of the CWB input must not be changed during the 6.25 μ s period before and after the rising edge of the CLOCK input.

[ENABLE (Controls forced OFF for A, AB, B, and selects BB and selects operation/hold mode of the hybrid IC)]

ENABLE=1: Normal operation

ENABLE=0: Outputs A, AB, B, and BB forced to the off state.

If, during the state where CLOCK signal input is provided, the ENABLE pin is set to 0 and then is later restored to the 1 state, the IC will resume operation with the excitation timing continued from before the point ENABLE was set to 0.

Enable must be initially set high for input as shown in the timing chart.

[MODE (Excitation mode selection)]

MODE=0: 2-phase excitation

MODE=1: 1-2 phase excitation

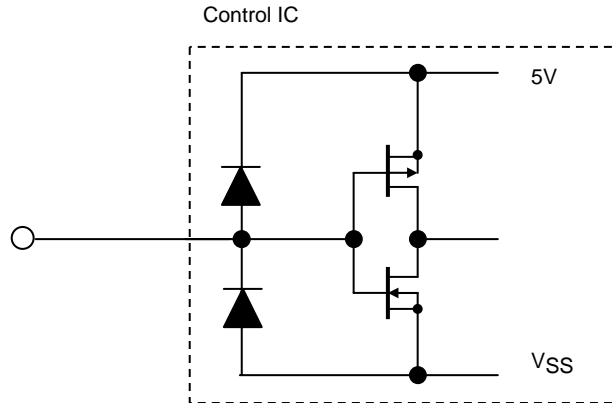

See the timing charts for details on output operation in these modes.

Note: The state of the MODE input must not be changed during the 5 μ s period before and after the rising edge of the CLOCK input.

[Configuration of Each Input Pin]

<Configuration of the MODE, CLOCK, CWB, RESETB, and ENABLE input pins>

Input pins: Pin 8, 9, 10, 11, and 12

All input pins of this driver support schmitt input. Typ specifications at $T_c = 25^\circ\text{C}$ are given below. Hysteresis voltage is 0.6V ($V_{IHa} - V_{ILa}$).

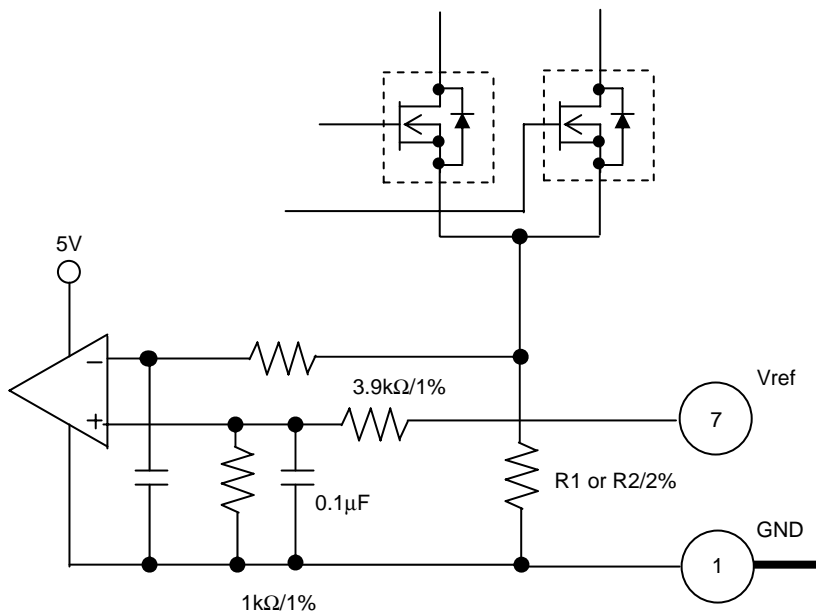

Input voltage specifications are as follows.

$V_{IH} = 2.5\text{V min}$

$V_{IL} = 0.6\text{V max}$

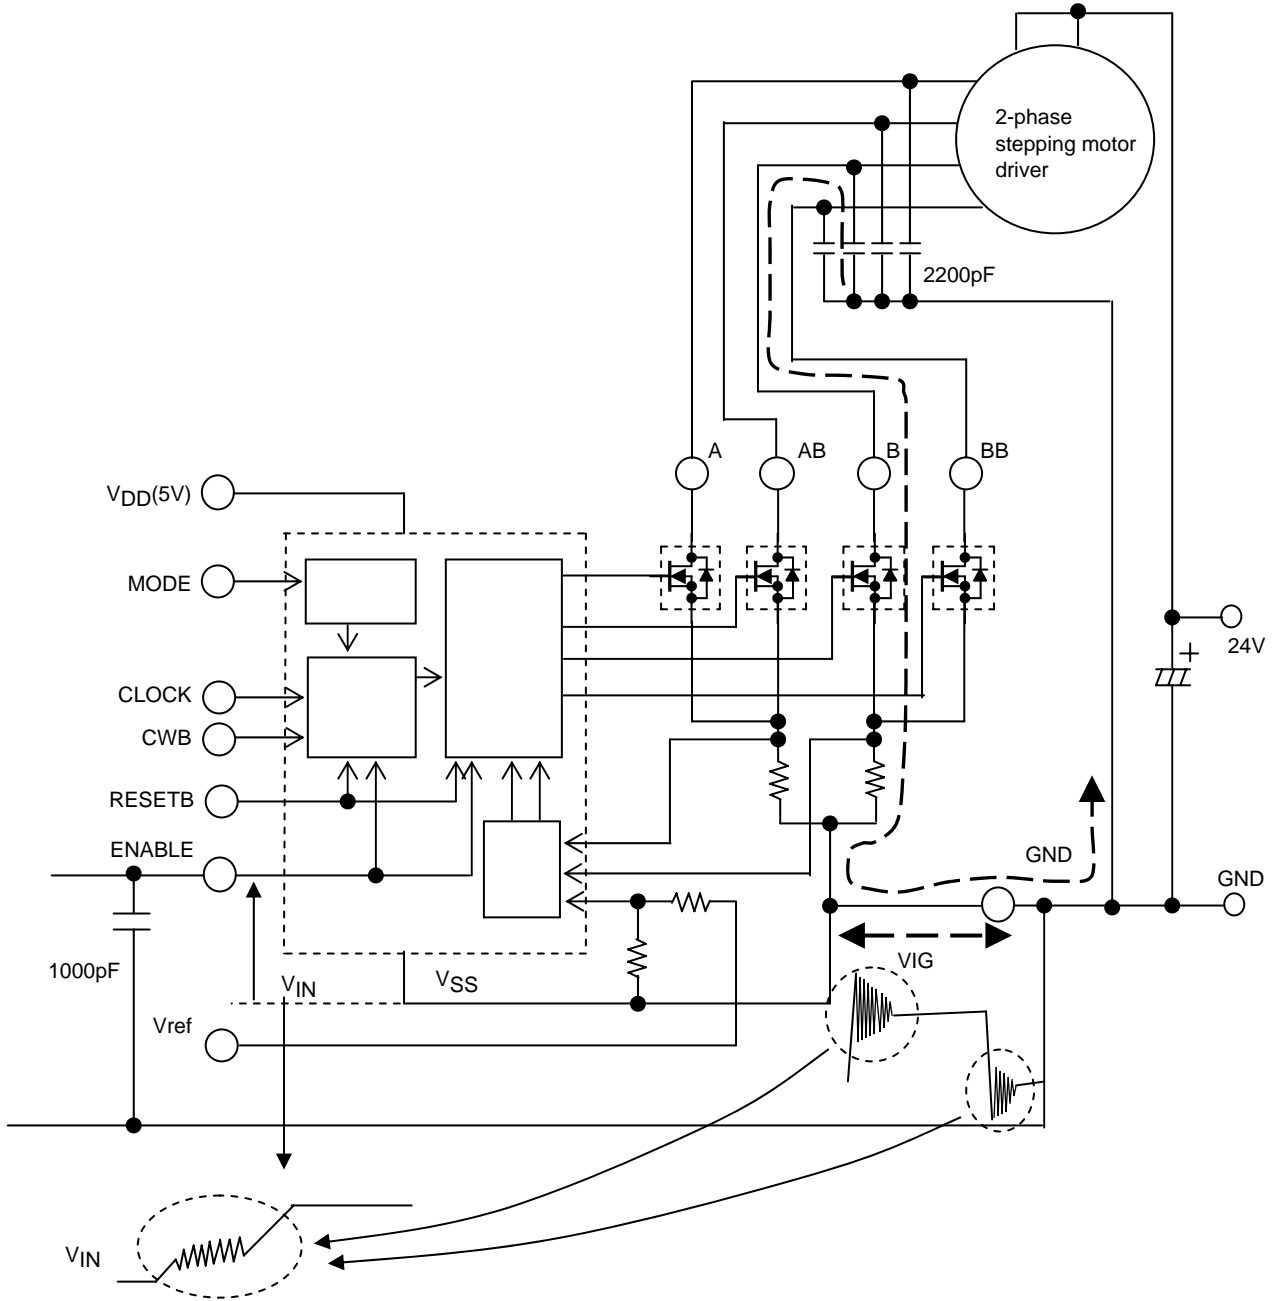

<Configuration of the Vref Input Pin>

Input pin: Pin 7

<Notes of input signals>

The longer rising and falling slew rate of input signals in hybrid IC, the more ringing signals on input signals increase, because input signals get ringing voltage VIG of GND wiring. Especially, when capacitances are connected output pins 2, 3, 4, 5 for preventing radiation noise, ringing signals increase by discharge and charge current in these. These ringing signals amplitude are input hysteresis voltage 0.6V over. Therefore, the driver actions in error, and it is destroyed by over current. So apply input signal slew rate as short as possible. We recommend using direct input to the driver by CMOS IC of HC model.

2. Calculating STK672-532 HIC Internal Power Loss

The average internal power loss in each excitation mode of the STK672-532 can be calculated from the following formulas.

Each excitation mode

2-phase excitation mode

$$2PdAV_{ex} = (V_{sat} + V_{df}) \times 0.5 \times \text{CLOCK} \times I_{OH} \times t_2 + 0.5 \times \text{CLOCK} \times I_{OH} \times (V_{sat} \times t_1 + V_{df} \times t_3)$$

1-2 phase excitation mode

$$1-2PdAV_{ex} = (V_{sat} + V_{df}) \times 0.25 \times \text{CLOCK} \times I_{OH} \times t_2 + 0.25 \times \text{CLOCK} \times I_{OH} \times (V_{sat} \times t_1 + V_{df} \times t_3)$$

Motor hold mode

$$\text{HoldPdAV}_{ex} = (V_{sat} + V_{df}) \times I_{OH}$$

V_{sat} : Combined voltage represented by the R_{on} voltage drop+shunt resistor

V_{df} : Combined voltage represented by the MOSFET body diode+shunt resistor

CLOCK: Input CLOCK (CLOCK pin signal frequency)

t_1 , t_2 , and t_3 represent the waveforms shown in the figure below.

t_1 : Time required for the winding current to reach the set current (I_{OH})

t_2 : Time in the constant current control (PWM) region

t_3 : Time from end of phase input signal until inverse current regeneration is complete

Motor COM Current Waveform Model

$$t_1 = (-L / (R + 0.45)) \ln(1 - ((R + 0.45) / V_{CC}) \times I_{OH})$$

$$t_3 = (-L / R) \ln((V_{CC} + 0.45) / (I_{OH} \times R + V_{CC} + 0.45))$$

V_{CC} : Motor supply voltage (V)

L : Motor inductance (H)

R : Motor winding resistance (Ω)

I_{OH} : Motor set output current crest value (A)

Relationship of CLOCK, t_1 , t_2 , and t_3 in each excitation mode

2-phase excitation mode: $t_2 = (2 / \text{CLOCK}) - (t_1 + t_3)$

1-2 phase excitation mode: $t_2 = (3 / \text{CLOCK}) - t_1$

For V_{sat} and V_{df} , be sure to substitute values from the graphs of V_{sat} vs. I_{OH} and V_{df} vs. I_{OH} while the set current value is I_{OH} .

Then, determine whether a heat sink is required by comparing with the graph of ΔT_c vs. P_d based on the average HIC power loss calculated.

When designing a heat sink, refer to the section “Thermal design” found on the next page. The average HIC power loss, P_dAV , described above does not have the avalanche’s loss. To include the avalanche’s loss, be sure to add Equation (2), “STK672-5** Allowable Avalanche Energy Value” to P_dAV above. When using this IC without a fin always check for temperature increases in the set, because the HIC substrate temperature, T_c , varies due to effects of convection around the HIC.

STK672-532

STK672-532 Output saturation voltage, V_{sat} - Output current, I_{OH}

STK672-532 Forward voltage, V_{df} - Output current, I_{OH}

Substrate temperature rise, ΔT_c (no heat sink) - Internal average power dissipation, P_{dAV}

3. STK672-532 Allowable Avalanche Energy Value

(1) Allowable Range in Avalanche Mode

When driving a 2-phase stepping motor with constant current chopping using an STK672-5** Series hybrid IC, the waveforms shown in Figure 1 below result for the output current, I_D , and voltage, V_{DS} .

Figure 1 Output Current, I_D , and Voltage, V_{DS} , Waveforms 1 of the STK672-5** Series when Driving a 2-Phase Stepping Motor with Constant Current Chopping

When operations of the MOSFET built into STK672-5** Series ICs is turned off for constant current chopping, the I_D signal falls like the waveform shown in the figure above. At this time, the output voltage, V_{DS} , suddenly rises due to electromagnetic induction generated by the motor coil.

In the case of voltage that rises suddenly, voltage is restricted by the MOSFET V_{DSS} . Voltage restriction by V_{DSS} results in a MOSFET avalanche. During avalanche operations, I_D flows and the instantaneous energy at this time, E_{AVL1} , is represented by Equation (1).

$$E_{AVL1} = V_{DSS} \times I_{AVL} \times 0.5 \times t_{AVL} \text{ ----- (1)}$$

V_{DSS} : V units, I_{AVL} : A units, t_{AVL} : sec units

The coefficient 0.5 in Equation (1) is a constant required to convert the I_{AVL} triangle wave to a square wave.

During STK672-5** Series operations, the waveforms in the figure above repeat due to the constant current chopping operation. The allowable avalanche energy, E_{AVL} , is therefore represented by Equation (2) used to find the average power loss, P_{AVL} , during avalanche mode multiplied by the chopping frequency in Equation (1).

$$P_{AVL} = V_{DSS} \times I_{AVL} \times 0.5 \times t_{AVL} \times f_c \text{ ----- (2)}$$

f_c : Hz units (f_c is set to the PWM frequency of 50kHz.)

For V_{DSS} , I_{AVL} , and t_{AVL} , be sure to actually operate the STK672-5** Series and substitute values when operations are observed using an oscilloscope.

Ex. If $V_{DSS}=110V$, $I_{AVL}=1A$, $t_{AVL}=0.2\mu s$ when using a STK672-532 driver, the result is:

$$P_{AVL} = 110 \times 1 \times 0.5 \times 0.2 \times 10^{-6} \times 50 \times 10^3 = 0.55W$$

$V_{DSS}=110V$ is a value actually measured using an oscilloscope.

The allowable loss range for the allowable avalanche energy value, P_{AVL} , is shown in the graph in Figure 3. When examining the avalanche energy, be sure to actually drive a motor and observe the I_D , V_{DS} , and t_{AVL} waveforms during operation, and then check that the result of calculating Equation (2) falls within the allowable range for avalanche operations.

(2) I_D and V_{DS} Operating Waveforms in Non-avalanche Mode

Although the waveforms during avalanche mode are given in Figure 1, sometimes an avalanche does not result during actual operations.

Factors causing avalanche are listed below.

- Poor coupling of the motor's phase coils (electromagnetic coupling of A phase and AB phase, B phase and BB phase).
- Increase in the lead inductance of the harness caused by the circuit pattern of the P.C. board and motor.
- Increases in V_{DSS} , t_{AVL} , and I_{AVL} in Figure 1 due to an increase in the supply voltage from 24V to 36V.

If the factors above are negligible, the waveforms shown in Figure 1 become waveforms without avalanche as shown in Figure 2.

Under operations shown in Figure 2, avalanche does not occur and there is no need to consider the allowable loss range of $PAVL$ shown in Figure 3.

ITF02558

Figure 2 Output Current, I_D , and Voltage, V_{DS} , Waveforms 2 of the STK672-5** Series when Driving a 2-Phase Stepping Motor with Constant Current Chopping

Figure 3 Allowable Loss Range, $PAVL-I_{OH}$ During STK672-532 Avalanche Operations

Note:

The operating conditions given above represent a loss when driving a 2-phase stepping motor with constant current chopping.

Because it is possible to apply 3.7W or more at $I_{OH}=0A$, be sure to avoid using the MOSFET body diode that is used to drive the motor as a zener diode.

4. Thermal design

[Operating range in which a heat sink is not used]

Use of a heat sink to lower the operating substrate temperature of the HIC (Hybrid IC) is effective in increasing the quality of the HIC.

The size of heat sink for the HIC varies depending on the magnitude of the average power loss, PdAV, within the HIC. The value of PdAV increases as the output current increases. To calculate PdAV, refer to “Calculating Internal HIC Loss for the STK672-532” in the specification document.

Calculate the internal HIC loss, PdAV, assuming repeat operation such as shown in Figure 1 below, since conduction during motor rotation and off time both exist during actual motor operations.

Figure 1 Motor Current Timing

T1: Motor rotation operation time

T2: Motor hold operation time

T3: Motor current off time

T2 may be reduced, depending on the application.

T0: Single repeated motor operating cycle

IO1 and IO2: Motor current peak values

Due to the structure of motor windings, the phase current is a positive and negative current with a pulse form.

Note that figure 1 presents the concepts here, and that the on/off duty of the actual signals will differ.

The hybrid IC internal average power dissipation PdAV can be calculated from the following formula.

$$PdAV = (T1 \times P1 + T2 \times P2 + T3 \times 0) \div T0 \text{ ----- (I)}$$

(Here, P1 is the PdAV for IO1 and P2 is the PdAV for IO2)

If the value calculated using Equation (I) is 1.5W or less, and the ambient temperature, Ta, is 60°C or less, there is no need to attach a heat sink. Refer to Figure 2 for operating substrate temperature data when no heat sink is used.

[Operating range in which a heat sink is used]

Although a heat sink is attached to lower Tc if PdAV increases, the resulting size can be found using the value of θc-a in Equation (II) below and the graph depicted in Figure 3.

$$\theta_{c-a} = (Tc \text{ max} - Ta) \div PdAV \text{ ----- (II)}$$

Tc max: Maximum operating substrate temperature = 105°C

Ta: HIC ambient temperature

Although a heat sink can be designed based on equations (I) and (II) above, be sure to mount the HIC in a set and confirm that the substrate temperature, Tc, is 105°C or less.

The average HIC power loss, PdAV, described above represents the power loss when there is no avalanche operation. To add the loss during avalanche operations, be sure to add Equation (2), “Allowable STK672-5** Avalanche Energy Value”, to PdAV.

Figure 2 Substrate temperature rise, ΔT_c - Internal average power dissipation, PdAV

Figure 3 Heat sink area (Board thickness: 2mm) - θ_{c-a}

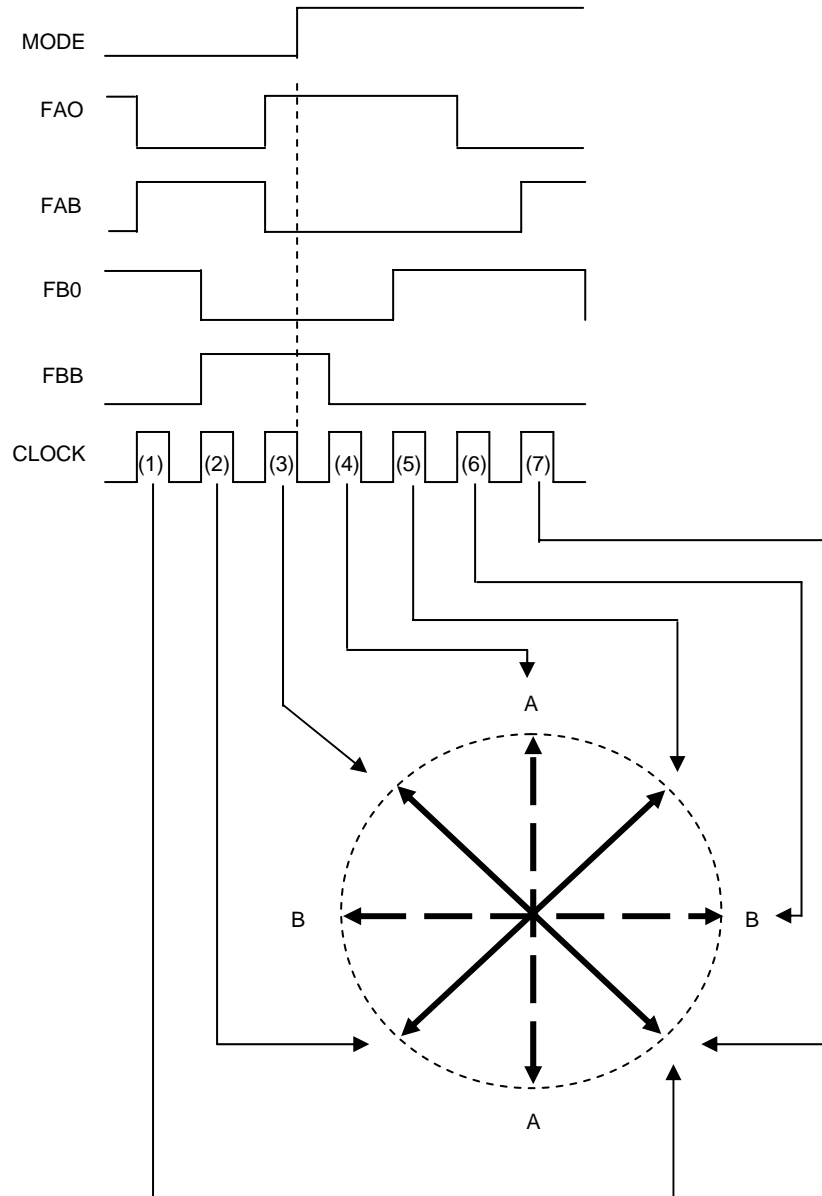

5. Changes in motor state when switching excitation with STK672-5** Series

Example 1: Switching from 2-phase to 1-2 phase excitation

Motor status is maintained when the excitation mode (MODE) is switched during motor rotation.

Because CLOCK cannot be detected when the interval between the rise in the MODE and CLOCK signals is 5μs or less, the mode may not change for one CLOCK cycle.

The solid arrows indicate 2-phase excitation, and dashed arrows indicate 1-phase excitation.

Example 2: Switching from 1-2 phase to 2-phase excitation

Motor status is maintained when the excitation mode (MODE) is switched during motor rotation.

Because CLOCK cannot be detected when the interval between the rise in the MODE signal and CLOCK signal is $5\mu\text{s}$ or less, the mode may not change for one CLOCK cycle.

The solid arrows indicate 2-phase excitation, and dashed arrows indicate 1-phase excitation.

Example 3: Switching from 1-2 phase to 2-phase excitation

Motor status is maintained when the excitation mode (MODE) is switched during motor rotation.

Because CLOCK cannot be detected when the interval between the rise in the MODE signal and CLOCK signal is 4μs or less, the mode may not change for one CLOCK cycle.

The solid arrows indicate 2-phase excitation, and dashed arrows indicate 1-phase excitation.
