

STK7560 Series

Chopper Type Parallel 2-Output Voltage Regulators

Applications

- Voltage regulator for printers, electronic typewriters, XY plotters.
- Voltage regulator for MSX personal computers, floppy disk drive, computer terminals, portable VTRs.

Features

- ICs having 2 outputs for microcomputer power supply (5V) and motor drive power supply (12, 15, 24, 36V) and being capable of delivering 2 regulated outputs from 1 rectifier.
- Good efficiency due to chopper type and no beat trouble due to fixed oscillation type oscillator common to 2 outputs.
- Independent overcurrent protectors for 2 outputs (Fold-back characteristics).
- Output 2 (drive power supply) can be turned ON/OFF by external signal. Two outputs can be also turned ON/OFF simultaneously by an external circuit connected (Refer to Sample Application Circuit).
- High-precision setting of output voltage, eliminating the need to use a variable resistor for adjustment.
- Input/output Gnd lines are united into one, facilitating combination with other negative power supply.
- A negative voltage regulator (-5V, -12V, etc.) can be connected externally (Refer to Sample Application Circuit).
- Output voltage/output current are provided in series.

(Note) 1 Output 2 cutoff (pin 1 input) : OUTPUT 2 cutoff at 1V or less, OUTPUT 2 ON at 3V or greater.

2 The peak current value of OUTPUT 1 (5V) is set to 120% of the rating.

3 The peak current value of OUTPUT 2 (12V, 15V, 24V, 36V) is set to 200% of the rating considering the motor driving mode.

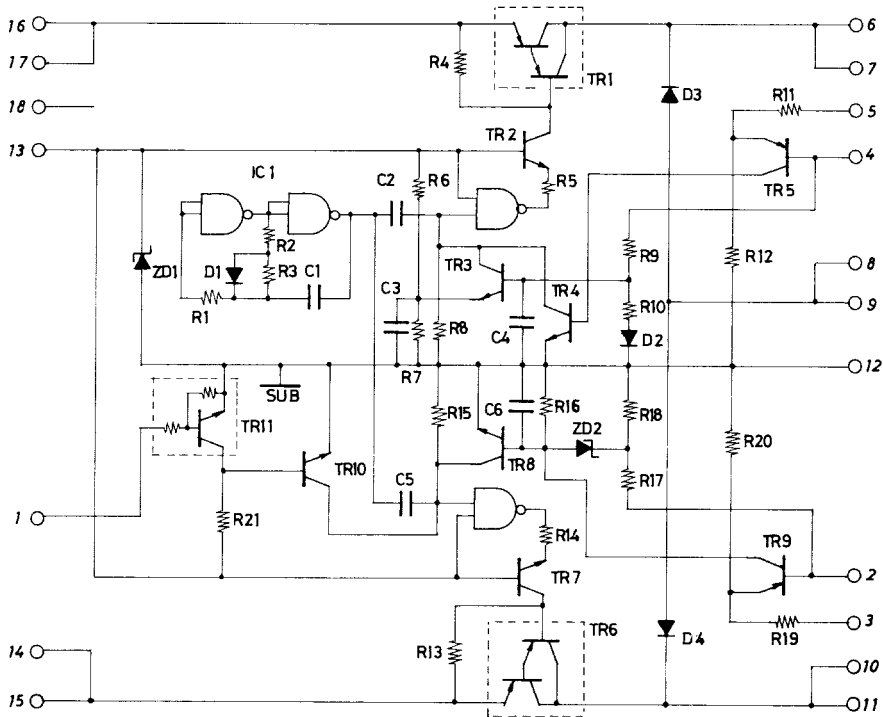

4 The secondary winding provided in the 5V choke coil makes OUTPUT 3 (-5V, 12V, -15V, 0.3A) available.

5 Peak current setting time.

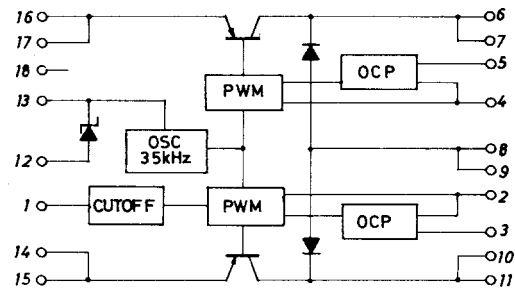

STK7560 Series

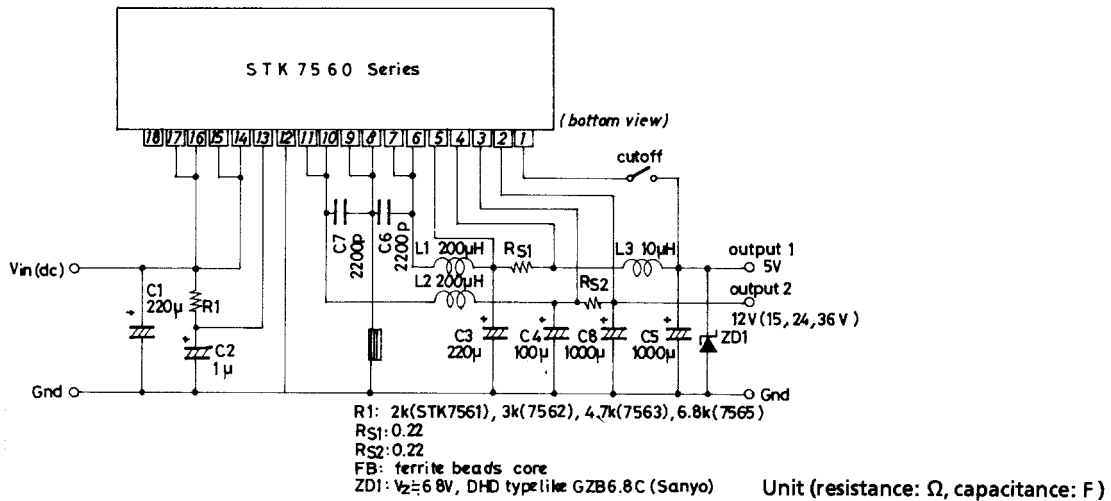

Equivalent Circuit

Equivalent Circuit Block Diagram and Pin Assignment

Sample Application Circuit 1 : Standard peripheral circuit

Note 1 The N. C pin (pin 18) must not be used as a relay pin for other line, pin.

2 Pins connected inside the IC (6-7, 8-9, 10-11, 14-15, 16-17) must be also connected on the printed circuit board.

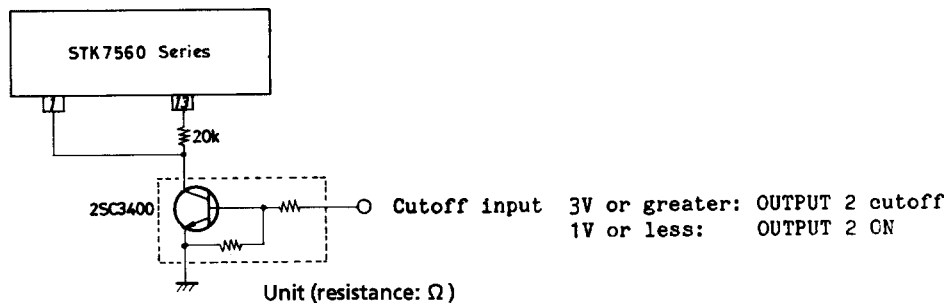

STK7560 Series

Sample Application Circuit 4 : STK7563F : 3 outputs of 5V, 24V, -12V

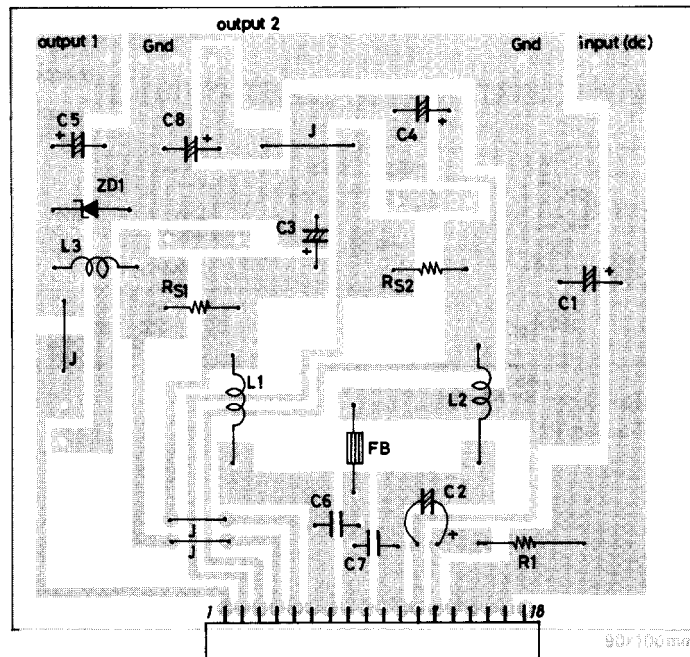

'High active' setting of cutoff input

'Low active' setting of cutoff input can be changed to 'High active' setting as shown below.

Sample Printed Circuit Pattern

Standard peripheral circuit for Sample Application Circuit 1 (Cu-foiled area)

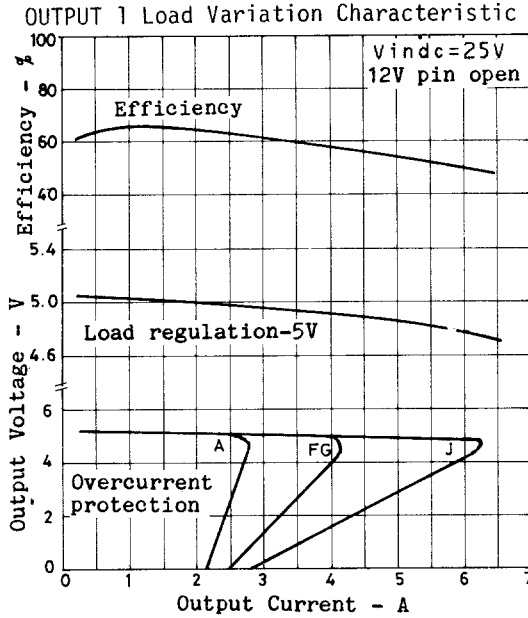

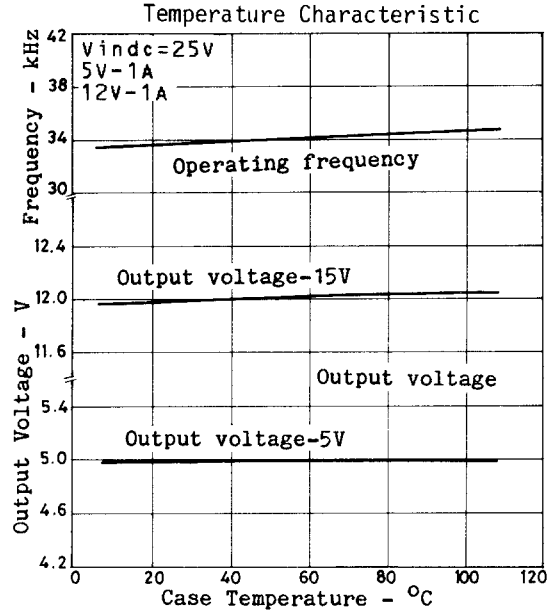

Precautions

- Make the large current-carrying lines thicker and shorter.
- Please high input capacitor C1 close to the input pin of the IC.
- Place switching spike-reducing C6, C7 close to the IC pins.
- Connect GND of ferrite bead core to GND of input capacitor C1 to minimize the core, C1-related pattern loop area.
- Connect V SENSE GND (pin 12) to GND of current line near the load.
- Connect GND of output capacitors C3, C4, C5, C8 near the load not to oppose current flow.
- Connect pins connected inside the IC (pins 6, 7, etc.) also on the printed circuit board.
- Do not use NC (pin 18) as a relay pin for otherline, pin.

Resons

- To minimize voltage loss on the pattern
- To minimize input ripple.
- To reduce switching spike more effectively.
- To reduce switching spike more effectively.
- To improve load regulation characteristic of output voltage.
- To improve ripple characteristic.
- To prevent current from concentrating on pin.

STK7561 Characteristics

STK7562 Characteristics

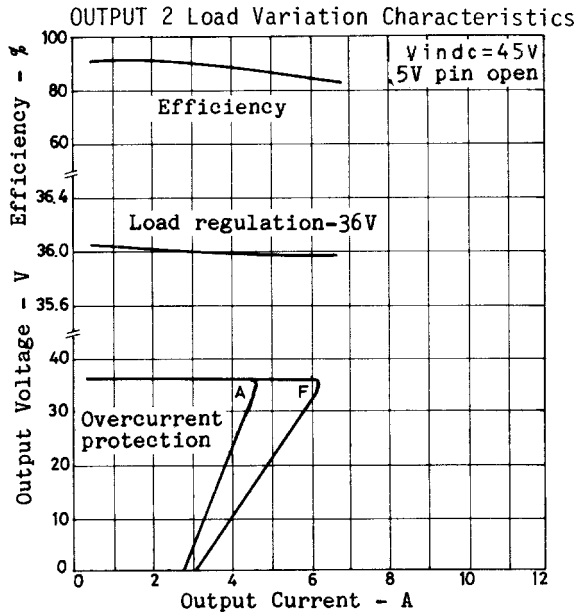

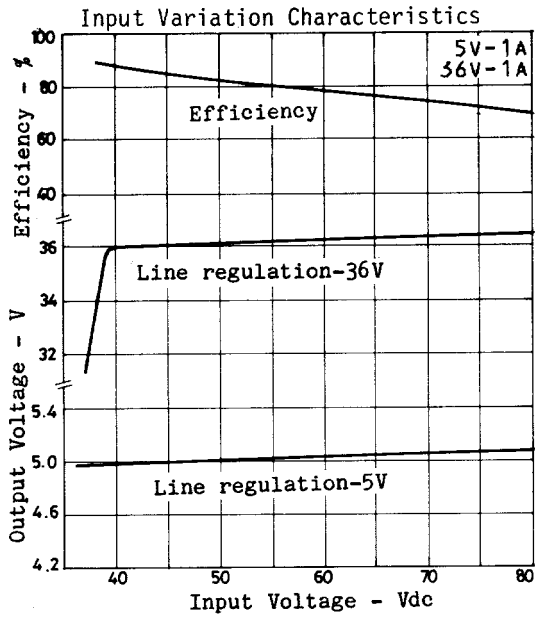

STK7560 Series

STK7563 Characteristics

STK7565 Characteristics

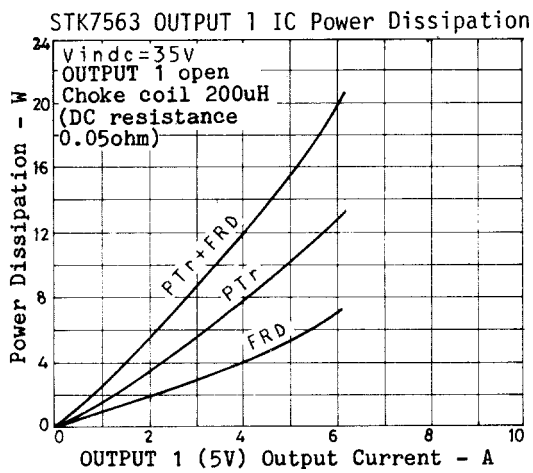

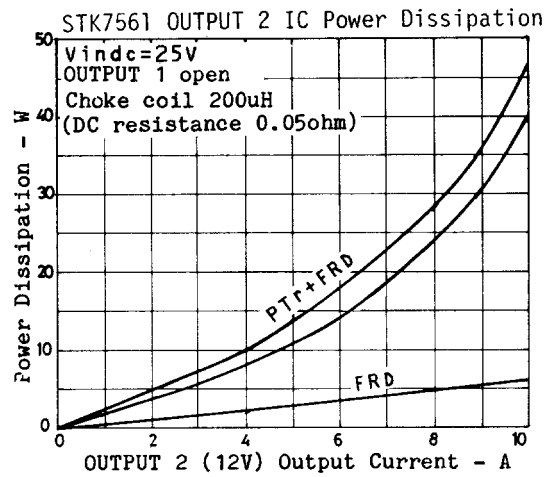

Thermal Design

Most power dissipation of STK7560 series-applied voltage regulators is caused by power transistor PTr, flywheel diode FRD, choke coil, current detect resistor.

Power detect parts are PTr FRD for the IC system, and TR1, D3 for OUTPUT 1, and TR6, D4 for OUTPUT 2. The relation between output current and power dissipation is shown below.

STK7560 Series

Assuming power dissipation in each element as follows :

P_{T1} for power transistor of OUTPUT 1

PF_1 for FRD of OUTPUT 1

PT_2 for power transistor of OUTPUT 2

PF_2 for FRD of OUTPUT 2

Total power dissipation P_d in the IC and heat sink thermal resistance θ_{ca} are :

$$P_d = (P_T + P_{F1}) + (P_{T2} + P_{F2}) \text{ [W]}$$

$$\theta_{ca} = \frac{T_c - T_a}{P_d} \text{ [}^\circ\text{C/W]}$$

where T_c : Case temperature= 105°C , T_a =Ambient temperature

Junction temperature in each element is :

$$T_j = P_d \times \theta_{jc} + T_c \text{ [}^\circ\text{C]}$$

STK7560 Series

where $T_j \text{ max}=150^\circ\text{C}$, P_d : Power dissipation P_{T1} , P_{F1} , P_{T2} , P_{F2} in each element, θ_{jc} =Junction-case thermal resistance in each element.

Type No.	Table of Thermal Resistance θ_{jc}			
	OUTPUT 1		OUTPUT 2	
	TR1	D3	TR6	D4
STK7560A	4.9	12.5	4.9	12.5
STK7560F STK7560G	4.7	12.5	2.7	5.5
STK7560J	2.7	5.5	4.7	12.5

To dissipate heat satisfactorily, use a heat sink with thermal resistance θ_{ca} meeting two temperature conditions of $T_c \text{ max}=105^\circ\text{C}$, $T_j \text{ max}=105^\circ\text{C}$.

Since the actual thermal resistance of the heat sink greatly depends on various conditions such as equipment layout or ventilation, allow an ample margin in thermal design. Shown right is the relation between Al heat sink area and thermal resistance. The Al surface coated with black improves thermal characteristic, lowering thermal resistance approximately 20% as compared with the Al heat sink of the same area.

Description of Operation of Internal Blocks

[OSC]

External excitation type OSC circuit where the CMOS NAND gate-used ring OSC is formed by the 2-stage NAND circuit, delivering basic pulses. This circuit provides pulse width modulation where the frequency is constant and the duty only varies.

[PWM]

Pulse width modulation (PWM) is provided by differentiating the output of NAND gate 2 using the differentiating circuit of time constant CR as shown left and by applying the result to the input of NAND gate 3.

The threshold voltage at the input of NAND gate 3 is approximately $1/2$ of supply voltage V_{DD} applied to the gate and the PWM output as shown below is obtained.

STK7560 Series

In the actual circuit transistor TR is connected in parallel with resistor R as shown left. The error signal from the constant-voltage output side is used to control the base current of TR so that the resistor value is varied equivalently to make the output voltage constant.

When the error signal is large, the base bias of TR is depend and the equivalent resistance gets small, narrowing the pulse width to control the output voltage.

When the error signal is small, the base bias of TR is shallowed, widening the pulse width to control the output voltage.

[OCP]

Overcurrent protection (OSC) is provided as follows : The voltage drop across current detect resistor R_s of the external connection circuit is detected to turn ON transistor TR1. Then, the collector current is applied to the base of TR2 to make time constant CR small, forcing the pulse width to be narrow.

The “fold-back” overcurrent characteristic occurs in which the pulse width is narrowd to drop the output voltage and also to decrease the output current.

[Cutoff]

The cutoff circuit (remote ON/OFF control) is so designed that the output is turned ON at ‘H’ level of cutoff input. In the circuit shown below, when the input is at ‘H’ level, TR1 is turned ON to drop the base voltage of TR2 and TR2 is turned OFF. Since TR2 is independent of the differentiating circuit composed of C and R, the output is turned ON.

When the input is at ‘L’ level, TR1 is turned OFF to increase the base voltage of TR2 and TR2 is turned ON. Since TR2 is connected in parallel with R of the differentiating circuit, R is short-circuited to make R of time constant CR 0 equivalently and the output is turned OFF.
