

## Product Description

The Stanford Microdevices' STM-3016 is a high linearity active mixer for use in a wide variety of communication systems covering the 2300-2700 MHz frequency bands. This device operates from a single 5V supply and provides 9dB of conversion gain while requiring only 0dBm input to the integrated LO driver. The STM-3016 also includes an integrated on chip IF amplifier and is fabricated using silicon germanium device technology.

The STM-3016 incorporates internal matching on each RF, IF, and LO port to enhance ease of use and to reduce the number of external components required. The IF and LO ports can be driven differential or single ended. Each broadband port has been designed to minimize performance degradation while operating into highly reactive components such as SAW filters.
