**DESCRIPTION**

The SY10/100E131 are high-speed quad master slave D-type flip-flops with differential outputs designed for use in new, high-performance ECL systems. The flip-flops may be individually clocked by holding Cc (Common Clock) at a logic LOW and then using the four individual  $\overline{CE}$  (Clock Enable  $\overline{CE}_0-\overline{CE}_3$ ) inputs to accomplish such clocking. Alternatively, all four flip-flops can be clocked in common by holding the  $\overline{CE}$  inputs LOW and then using Cc to clock the data. In the common clock mode, the  $\overline{CE}$  input acts as a control that passes the Cc signal to the flip-flop. Data is clocked into the flip-flop on the rising edge of the output of the logical OR operation between  $\overline{CE}$  and Cc (data enters the master when both Cc and  $\overline{CE}$  are LOW and data transfers to the slave when either  $\overline{CE}$  or Cc, or both, go HIGH).

Asynchronous set and reset controls are provided. The reset controls are individual and the set controls are pairwise.
