

FEATURES

- Differential D, clock and Q
- Extended 100E VEE range of -4.2V to -5.5V
- VBB output for single-ended use
- 1100MHz min. toggle frequency
- Edge-triggered asynchronous set and reset
- Fully compatible with Motorola MC10E/100E431
- Available in 28-pin PLCC package

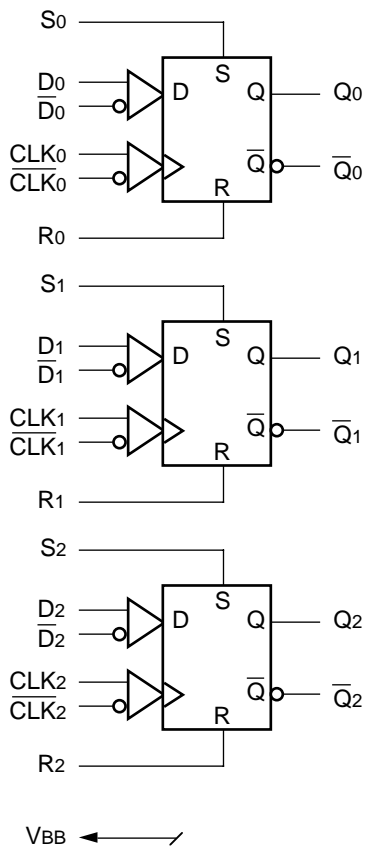

DESCRIPTION

The SY10/100E431 are 3-bit flip-flops with differential clock, data input and data output.

The asynchronous Set and Reset controls are edge-triggered rather than level controlled. This allows the user to rapidly set or reset the flip-flop and then continue clocking at the next clock edge without the necessity of de-asserting the set/reset signal (as would be the case with a level controlled set/reset).

The E431 is also designed with larger internal swings, an approach intended to minimize the time spent crossing the threshold region and thus reduces the metastability susceptibility window.

Notes:

- These set-up times define the minimum time the CLK or SET/RESET input must wait after the assertion of the RESET/SET input to assure the proper operation of the flip-flop.
- Within-device skew is defined as identical transitions on similar paths through a device.
- Minimum input swing for which AC parameters are guaranteed.
