

TOSHIBA BIPOLAR LINEAR INTEGRATED CIRCUIT SILICON MONOLITHIC

TA8198F

DC/DC CONVERTER FOR ELECTRIC TUNING (3V USE)

The TA8198F is a DC/DC converter IC which is developed for biasing varactor diodes of tuner system. It is especially suitable for supplying high voltage (about 15.5V) for digital tuning (FM/TV/AM) system of headphone stereos, radio cassette recorders, or other equipments.

FEATURES

- Few external parts.
- Excellent spurious radiation by oscillation of sine wave.
- Built-in constant current source, it is suitable for digital tuning system. (I_{CTL} can be controlled by R_{CTL})
- Output voltage $V_O = 15.5V$ (Typ.)
- Excellent regulatory capability of output voltage against fluctuation of supply voltage, and of ambient temperature.
- Built-in power switch
- Low supply current (at non-load, $V_{CC} = 3V$, $T_a = 25^\circ C$) $I_{CCQ} = 2.4mA$ (Typ.)
- Operating supply voltage range ($T_a = 25^\circ C$) $V_{CC(opr)} = 1.8 \sim 10V$

● TOSHIBA is continually working to improve the quality and the reliability of its products. Nevertheless, semiconductor devices in general can malfunction or fail due to their inherent electrical sensitivity and vulnerability to physical stress. It is the responsibility of the buyer, when utilizing TOSHIBA products, to observe standards of safety, and to avoid situations in which a malfunction or failure of a TOSHIBA product could cause loss of human life, bodily injury or damage to property. In developing your designs, please ensure that TOSHIBA products are used within specified operating ranges as set forth in the most recent products specifications. Also, please keep in mind the precautions and conditions set forth in the TOSHIBA Semiconductor Reliability Handbook.

TERMINAL EXPLANATION

Terminal voltage : Typical terminal voltage with test circuit ($V_{CC} = 3V, T_a = 25^\circ C$)

TERMINAL No.	TERMINAL NAME	FUNCTION	INTERNAL CIRCUIT	TERMINAL VOLTAGE (V)
1	DET	Boosted output (Voltage double rectifier)		—
2	V_O			15.5
5	C_F			1.4
3	I_{CTL}	Constant current source output (for digital tuning) V_O supplies this circuit with power source.		—
4	CTL	In case that this circuit isn't used, the I_{CTL} terminal is connected with GND line.		—
6	PW SW	Power on / off switch (V_{CC} : Power on GND / OPEN : Power off)		—
7	FB	Hartley type oscillator $f_{OSC} \doteq \frac{1}{2\pi\sqrt{L_3 \cdot C_2}}$ Controlling oscillation current at the terminal of FB.		1.4
8	V_{CC}			3.0
9	OSC			—
10	GND	—	—	0

APPLICATION NOTE

1. PW SW

It is necessary to connect an external pull-down resistor with the terminal PW SW (pin 6), in case that this IC is turned on due to external noise etc.

2. Designing of coil

This IC has the output voltage by means of boosting the oscillation voltage, derived from Hartley type oscillator circuit and of voltage-double rectifier with C₃, D₁ and D₂.

(1) Designing of oscillation frequency

$$f_{OSC} \doteq \frac{1}{2\pi\sqrt{L_3 \cdot C_2}}$$

(2) Coil turns can be designed as following

$$V_{OSC(p-p)} = 2 (V_{CC(min)} - V_{CE1(sat)})$$

$$n = \frac{n_3}{n_2} \doteq \frac{V_O}{V_{OSC(p-p)}}$$

Note : V_{CC(min)} : Minimum of supply voltage designed by a equipment

V_{CE1(sat)} : Saturation voltage of Q₁

n : Coil turns ratio (L₂, L₃)

V_O : Output voltage V_O = 15.5V (Typ.)

The turn of L₁ is designed, so as to make the terminal of FB be about 200~300mV_{p-p} through C₁. The turn of L₁ should be small, and the capacitance of C₁ and Q₀ of coil should be large, for the oscillation start at turning power on.

(3) Allowance is advisable for coil design of n, Q₀. However, spurious radiation can be reduced, in case that the output current and n of coil don't make large.

3. Pattern Diagram

The Fig.2 shows the oscillation loop. This pattern diagram should be small, because spurious radiation due to the oscillation is reduced.

The Fig.3 shows the rectifier loop. This pattern diagram should be of the small, because spurious radiation due to the switching rectifier is reduced. The two loops should be isolated from other DC lines.

Fig.1 Oscillator and Voltage-Double

Fig.2 Oscillation Loop

Fig.3 Rectifier Loop

4. I_{CTL}

I_{CTL} can be controlled by R_{CTL} resistor between pin 4 and GND (see Fig.4).

Fig.4 I_{CTL} - R_{CTL}

MAXIMUM RATINGS ($T_a = 25^\circ C$)

CHARACTERISTIC	SYMBOL	RATING	UNIT
Supply Voltage	V_{CC}	12	V
Output Voltage	V_O	18	
Constant Current Source Circuit Output Current	I_{CTL}	2	mA
Power Dissipation	P_D (Note)	400	mW
Operating Temperature	T_{opr}	- 25~75	$^\circ C$
Storage Temperature	T_{stg}	- 55~150	

(Note) Derated above $T_a = 25^\circ C$ in the proportion of 3.2mW.

CHARACTERISTIC CURVES

(Unless otherwise specified : $V_{CC} = 3V$, $f_{OSC} = 3MHz$, $I_O = 100\mu A$, $I_{CTL} = 0$, $T_a = 25^\circ C$)
