

COLOUR DEMODULATOR COMBINATION

The TDA2520 is an integrated synchronous demodulator combination for colour television receivers incorporating the following functions :

- 8, 8 MHz oscillator followed by a divider giving two 4, 4 MHz signals used as reference signals
- keyed burst phase detector for optimum noise behaviour
- a stage to obtain chrominance signal control (a. c. c.) and an a. c. c. reference level
- a colour killer and identification signal detector
- two synchronous demodulators for the (B-Y) and (R-Y) signals
- temperature compensated emitter follower outputs
- PAL switch
- PAL flip-flop
- integrated capacitors in the symmetrical demodulators reduce unwanted carrier-signals at the outputs.

blanking: active for V_{15-16} > 2 V
inactive for V_{15-16} < 1 V

1) The demodulators are driven by a chrominance signal of equal amplitude for the (R-Y) and the (B-Y) components. The phase of the (R-Y) chrominance signal equals the phase of the (R-Y) reference signal.

The same holds for the (B-Y) signals.

2) As under note 1, but the phase of the (R-Y) reference signal reversed.

3) The d. c. level of the colour difference outputs can be adjusted from 6 to 10 V at pin 4.
