1997 Nov 12

# I<sup>2</sup>C-bus controlled economic BTSC stereo decoder

TDA9851

## FEATURES

- Voltage Controlled Amplifier (VCA) noise reduction circuit
- Stereo or mono selectable at the AF outputs
- Stereo pilot PLL circuit with ceramic resonator
- Automatic pilot cancellation
- Automatic Volume Level (AVL) control (+6 to –15 dB)
- I<sup>2</sup>C-bus transceiver.

## GENERAL DESCRIPTION

The TDA9851 is a bipolar-integrated BTSC stereo decoder for application in TV sets, VCRs and multimedia PCs.

## QUICK REFERENCE DATA

TDA9851

## FUNCTIONAL DESCRIPTION

### Stereo decoder

The composite signal is fed into a pilot detector/pilot cancellation circuit and into the MPX demodulator. The main L + R signal passes a 75  $\mu$ s fixed de-emphasis filter and is fed into the dematrix circuit. The decoded sub-signal L – R is sent to the VCA circuit. To generate the pilot signal the stereo demodulator uses a PLL circuit including a ceramic resonator.

### Mode selection

The L – R signal is fed via the internal VCA circuit to the dematrix/switching circuit. Mode selection is achieved via the I<sup>2</sup>C-bus.

### Automatic volume level control

The automatic volume level stage controls its output voltage to a constant level of typically 200 mV (RMS) from

an input voltage range between 0.1 to 1.1 V (RMS). The circuit adjusts variations in modulation during broadcasting and because of changes in the programme material. The function can be switched off. To avoid audible plops during the permanent operation of the AVL circuit a soft blending scheme has been applied between the different gain stages. A capacitor (4.7  $\mu$ F) at pin C<sub>AV</sub> determines the attack and decay time constants. In addition the ratio of attack and decay times can be changed via the I<sup>2</sup>C-bus.

### Integrated filters

The filter functions necessary for stereo demodulation are provided on-chip using transistor circuits. The filter frequencies are controlled by the filter reference circuit via the external resistor R4.

## LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC 134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V <sub>CC</sub>	supply voltage		0	9.9	V
V <sub>SDA</sub> , V <sub>SCL</sub>	voltage of SDA and SCL to GND	V <sub>CC</sub> < 9 V	0	V <sub>CC</sub>	V
		V <sub>CC</sub> ≥ 9 V	0	9	V
V <sub>n</sub>	voltage of all other pins to GND		0	V <sub>CC</sub>	V
T <sub>amb</sub>	operating ambient temperature	T <sub>j</sub> < 125 °C	–20	+70	°C
T <sub>stg</sub>	storage temperature		–65	+150	°C

### Notes to the characteristics

- The oscillator is designed to operate together with Murata resonator CSB503F58 or CSB503JF958 as SMD. Change of the resonator supplier is possible, but the resonator specification must be close to the specified ones.
- The AVL input voltage is internal. It corresponds to the output voltage OUTL and OUTR at AVL off.
- The listed pin voltage corresponds with typical gain steps of +6 dB, +3 dB, 0 dB, –6 dB and –15 dB.
- Attack time constant = C<sub>CAV</sub> × R<sub>att</sub>.

$$C_{CAV} \times 0.76 \text{ V} \left( 10^{\frac{-G_1}{20}} - 10^{\frac{-G_2}{20}} \right)$$

- Decay time =  $\frac{C_{CAV} \times 0.76 \text{ V} \left( 10^{\frac{-G_1}{20}} - 10^{\frac{-G_2}{20}} \right)}{I_{dec}}$

Example: C<sub>CAV</sub> = 4.7 μF; I<sub>dec</sub> = 2 μA; G<sub>1</sub> = –9 dB; G<sub>2</sub> = +6 dB → decay time results in 4.14 s.

- When reset is active the GMU bit (mute) is set and the I<sup>2</sup>C-bus receiver is in the reset position.
- The AC characteristics are in accordance with the I<sup>2</sup>C-bus specification for standard mode (clock frequency maximum 100 kHz). A higher frequency, up to 280 kHz, can be used if all clock and data times are interpolated between standard mode (100 kHz) and fast mode (400 kHz) in accordance with the I<sup>2</sup>C-bus specification. Information about the I<sup>2</sup>C-bus can be found in brochure "I<sup>2</sup>C-bus and how to use it" (order number 9398 393 40011).

### SOLDERING

#### Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our "IC Package Databook" (order code 9398 652 90011).

#### SDIP

##### SOLDERING BY DIPPING OR BY WAVE

The maximum permissible temperature of the solder is 260 °C; solder at this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ( $T_{stg\ max}$ ). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

##### REPAIRING SOLDERED JOINTS

Apply a low voltage soldering iron (less than 24 V) to the lead(s) of the package, below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than 300 °C it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and 400 °C, contact may be up to 5 seconds.

#### SO

##### REFLOW SOLDERING

Reflow soldering techniques are suitable for all SO packages.

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several techniques exist for reflowing; for example, thermal conduction by heated belt. Dwell times vary between 50 and 300 seconds depending on heating method. Typical reflow temperatures range from 215 to 250 °C.

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 minutes at 45 °C.

##### WAVE SOLDERING

Wave soldering techniques can be used for all SO packages if the following conditions are observed:

- A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.
- The longitudinal axis of the package footprint must be parallel to the solder flow.
- The package footprint must incorporate solder thieves at the downstream end.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder is 10 seconds, if cooled to less than 150 °C within 6 seconds. Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

##### REPAIRING SOLDERED JOINTS

Fix the component by first soldering two diagonally-opposite end leads. Use only a low voltage soldering iron (less than 24 V) applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C. When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

## DEFINITIONS

<b>Data sheet status</b>	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
<b>Limiting values</b>	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
<b>Application information</b>	
Where application information is given, it is advisory and does not form part of the specification.	

## LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.

## PURCHASE OF PHILIPS I<sup>2</sup>C COMPONENTS

Purchase of Philips I<sup>2</sup>C components conveys a license under the Philips' I<sup>2</sup>C patent to use the components in the I<sup>2</sup>C system provided the system conforms to the I<sup>2</sup>C specification defined by Philips. This specification can be ordered using the code 9398 393 40011.
