

## TELEPHONE ANALOG FRONT END

### SPEECH

- DC LINE CURRENT RANGE FROM 6 TO 120mA
- EXTERNALLY ADJUSTABLE :
  - Tx AND Rx GAIN
  - MAXIMUM TRANSMIT LEVEL
  - RETURN LOSS
  - SIDETONE NETWORKS
  - Tx AND Rx AGC (LINE CURRENT START UP VALUE AND SLOPE)
- SOFTCLIPPING ON Tx CHANNEL
- SQUELCH ON Tx CHANNEL TO REDUCE NOISE ENVIRONMENT AND TO IMPROVE HOWLING IMMUNITY IN LOUDHEARING MODE
- RECEIVING AMPLIFIER FOR PIEZO AND ELECTRODYNAMIC TRANSDUCERS
- FREQUENCY GENERATOR FOR WAITING MELODY
- ERROR BEEP GENERATOR
- HOLD LINE CURRENT DETECTOR FOR TRANSFER/AUTO RELEASE FEATURE
- PROGRAMMABLE BY MICROCONTROLLER SERIAL BUS :
  - -6dB ON Tx CHANNEL
  - +6dB ON Rx CHANNEL
  - AGC INHIBITION ON Tx AND Rx CHANNELS FOR PABX USE
  - SQUELCH INHIBITION

### GROUP LISTENING / ON HOOK DIALING

- ANTI-HOWLING WITH ACOUSTIC FEED-BACK SYSTEM COUPLED TO SQUELCH
- RING MELODY CONTROL AND ERROR BEEP GENERATORS
- PROGRAMMABLE BY MICROCONTROLLER SERIAL BUS :
  - DIGITAL VOLUME CONTROL (7 STEPS OF 4dB EACH) AND OFF MODE

### HANDFREE INTERFACE

- PINS AND SOFTWARE FACILITY FOR EASY INTERCONNECTION WITH HANDSFREE CONTROLLER I.C. LIKE TEA7540

### RING ON LOUDSPEAKER

- EMBEDDED SWITCH MODE POWER SUPPLY DRIVER TO FEED THE LOUDSPEAKER AMPLIFIER DURING RING MODE

- PROGRAMMABLE BY MICROCONTROLLER SERIAL BUS :
  - DIGITAL VOLUME CONTROL (15 STEPS OF 4dB EACH) AND OFF MODE
  - RING FREQUENCY GENERATOR (MORE THAN 200 FREQUENCIES AVAILABLE)

### DIALING

- PROGRAMMABLE BY MICROCONTROLLER SERIAL BUS :
  - DTMF GENERATOR
  - 2V DC LINE VOLTAGE DURING THE MAKE PERIOD IN PULSE MODE

### MICROCONTROLLER INTERFACE

- 3.5V STABILIZED SUPPLY
- TWO WIRES SERIAL BUS INTERFACE
- RING INDICATOR
- PON LINE CURRENT INDICATOR
- RESET SIGNAL
- LINE CURRENT VARIATION INDICATOR (FOR TRANSFER FEATURE)
- OSCILLATOR WITH STAND BY MODE

### CORDLESS AND ANSWERING MACHINE INTERFACE

- SELF BIASED LOUDSPEAKER AMPLIFIER AND MICROCONTROLLER INTERFACE FOR ANSWERING MACHINE
- SIGNAL INPUT AND OUTPUT INTERFACE FOR CORDLESS
- $V_{RMC}$  SUPPLY CAN BE EXTERNALLY FORCED TO 5V FOR EASY INTERFACE WITH A MAIN POWERED MICROCONTROLLER

**TQFP44**  
(Plastic Quad Flat Package)

**ORDER CODES : TEA7092TQ - TEA7092TQT**

# TEA7092

## DESCRIPTION

The TEA7092 is a Telephone set Analog Front End (TAFE) interface intended for use in conjunction with a microcontroller.

In this configuration the TEA7092 provides a worldwide telephone set with loudhearing and melody ringer on loudspeaker. An handsfree telephone set can be built by adding the TEA7540 handsfree controller.

The simple interface with a +5V main supply allows to use the TEA7092 in terminal like Answering machine, FAX and cordless base station.

Repertory dialer (memory on MCU) and various features (HOLD, Tone/Pulse, Flash, Mute, adjustable Ringer and Loudspeaker levels...) are programmable by the MCU through the serial bus interface.

The MCU through the serial bus interface.

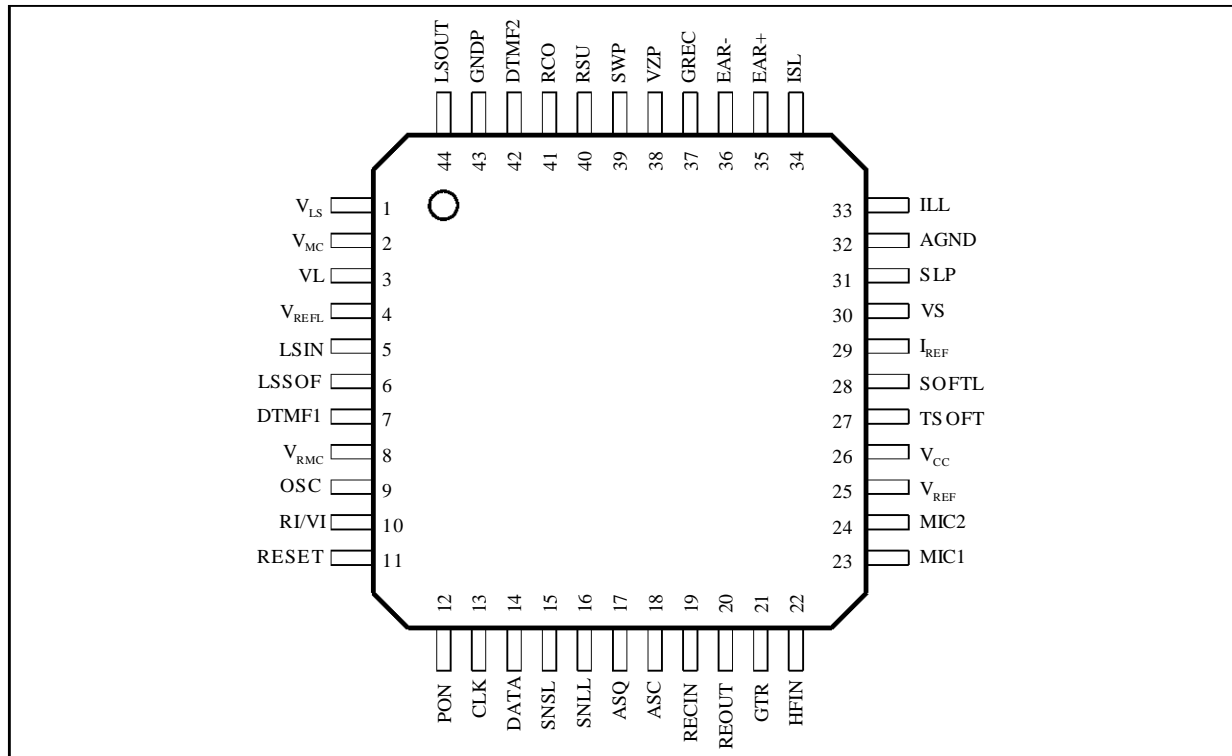

The concept using TAFE and Microcontroller is called BICHIP approach.

## BENEFITS

The benefits of this concept are :

- Saving of external components.
- Easy upgrade of the features (memories, LCD driver, Answering machine, FAX, Cordless ...).
- Replacement of configuration switches (PABX/Public, Tone/Pulse) and potentiometers for loudspeaker and ringer control, by EEPROM settings.
- Reliability and cost improvements.

## PIN CONNECTIONS

## PIN DESCRIPTION

Pin Number	Name	Description
1	V <sub>LS</sub>	Loudspeaker Power Supply
2	V <sub>MC</sub>	Unregulated Input of Microcontroller Power Supply
3	VL	Transmit Output
4	V <sub>REFL</sub>	Loudspeaker Reference Voltage (V <sub>LS</sub> /2)
5	LSIN	Loudspeaker Amplifier Input
6	LSSOF	Loudspeaker Softclipping Time Constant
7	DTMF1	DTMF Filter 1
8	V <sub>RMC</sub>	Stabilized Microcontroller Power Supply
9	OSC	Oscillator Input
10	RI/VI	Ring Indicator / Line Current Variation Indicator
11	RESET	Microcontroller Reset Output
12	PON	Line Current Indicator Output
13	CLK	Serial Bus Clock Input
14	DATA	Serial Bus Data Input
15	SNSL	Short Line Sidetone Network Input
16	SNLL	Long Line Sidetone Network Input
17	ASQ	Antiacoustic & Squelch Time Constant
18	ASC	DC Offset Cancellation of Squelch Amplifier
19	RECIN	Receive Input
20	REOUT	Receive Output for Handsfree Interface & Loudspeaker Input
21	GTR	Transmit Gain Adjustment
22	HFIN	Handsfree Microphone Input Referenced to V <sub>REF</sub>
23	MIC1	Microphone Input 1 Referenced to V <sub>REF</sub>
24	MIC2	Microphone Input 2 Referenced to V <sub>REF</sub>
25	V <sub>REF</sub>	Speech Reference Voltage (V <sub>CC</sub> /2)
26	V <sub>CC</sub>	Speech Power Supply
27	TSOFT	Transmit Softclipping Time Constant
28	SOFTL	Softclipping Adjustment
29	I <sub>REF</sub>	Resistor to Set Reference Current
30	VS	Active Self Inductor & DC Characteristic Adjustment
31	SLP	DC Mask Slope Adjustment
32	AGND	Analog Ground & Negative Line Voltage
33	ILL	Long Line Speech Control Adjustment (GMAX)
34	ISL	Short Line Speech Control Adjustment (GMAX-6dB)
35	EAR+	Earphone Output
36	EAR-	Earphone Output
37	GREC	Receive Gain Adjustment
38	VZP	Switch Mode Power Supply Internal Zener
39	SWP	Switch Mode Power Supply Output Switch
40	RSU	Ring Start-up Level
41	RCO	Ring Power Output Control
42	DTMF2	DTMF Filter 2
43	GND	Power Ground & Negative Line Voltage
44	LSOUT	Loudspeaker Output

**DC CHARACTERISTICS** (T<sub>amb</sub> = 25°C, see Test 1)

Between I<sub>L</sub> = 8mA and I<sub>L</sub> = 20mA the DC slope is fixed by RS and RSLP :

$$V_L(I_L) = RS \times (40E^{-6} + 0.5E^{-3} \times I_L) + RSLP/55 \times (I_L - 5.6E^{-3}).$$

For line current higher than 20mA the slope is fixed by RSLP : V<sub>L</sub>(I<sub>L</sub>) = V<sub>L</sub>(20E-3) + RSLP/55 x (I<sub>L</sub> - 20E-3).

Symbol	Parameter	Test Conditions	Min.	Typ.	Max.	Unit

**RETURN LOSS** (T<sub>amb</sub> = 25°C, see Test 2)

Symbol	Parameter	Test Conditions	Min.	Typ.	Max.	Unit
R <sub>Loss</sub>	Return Loss	I <sub>L</sub> = 20mA, f = 1000Hz	20	23		dB

7092-04.TBL

**TRANSMIT CHARACTERISTICS**

The maximum gain G<sub>tl</sub> is adjustable between 44 and 56dB versus RGT value

$$G_{tl} = 20 \times \log \left( 820 \times \frac{(RZ // RL + R3) // Z_{IN}}{RGT // 50k\Omega} \right)$$

Z<sub>IN</sub> = internal impedance at Pin V<sub>L</sub> # 8kΩ.

The AGC variation is programmable through two external resistors connected on Pins ILL and ISL. ILL is the line current at which the gain is at the maximum value and ISL is the line current at which the gain is at the maximum value minus 6dB. For line current lower than ILL or higher than ISL, the transmit and receive gains have a constant value. The following formulas give RLL and RSL values versus ILL and ISL.

$$RSL = \frac{310}{ISL - 5.6mA} \text{ and } RLL = \frac{310}{ILL - 5.6mA}$$

**Tx Softclipping** (see Figure 2)

**Figure 2 :** Tx Softclipping and Distortion at I<sub>L</sub> = 20mA

7092-04.EFS

**TRANSMIT CHARACTERISTICS (continued)**

**Maximum Level on Line in Tx (see Figure 3)**

The minimum operating voltage of the TEA7092 is 2.5V. At low line current value, when the voltage over the TEA7092 is low, the softclipping function automatically limits the AC dynamic to avoid to reach the 2.5V limit on the TEA7092.

When the DC voltage over the TEA7092 is high enough, the AC dynamic is limited at a value fixed by the external resistor RSOFT connected on Pin SOFTL.

The Value of RSOFT is performed by :  $RSOFT = (RS \times 50E^{-6} - 0.8 - VacPeak) / 40E^{-6}$

**Tx Characteristics (T<sub>amb</sub> = 25°C, f = 1kHz, see Test 3)**

Symbol	Parameter	Test Conditions	Min.	Typ.	Max.	Unit

**Squelch on Transmit Channel (T<sub>amb</sub> = 25°C, f = 1kHz, I<sub>L</sub> = 20mA, see Test3)**

The principle of the squelch is to reduce the transmit gain as soon as the amplitude of the signal on the microphone is lower than a fixed threshold voltage, VT2.

Symbol	Parameter	Test Conditions	Min.	Typ.	Max.	Unit
Gtlmax Gtlmax-Gsq	Transmit Gain	V <sub>em1</sub> = -75dBV V <sub>em2</sub> = -65dBV		36 45		dB dB

Mrx	Mute	Test 2, $I_L = 20\text{mA}$ , $V_L = -9\text{dBV}$	60			dB
Z <sub>IN</sub>	Input Impedance	Between Pins SNSL & SNLL		120	150	k $\Omega$
Z <sub>OUT</sub>	Output Impedance			5		$\Omega$

The sidetone of the TEA7092 uses two networks, these two networks are internally mixed between long line length and short line length.

The following equation gives the sidetone impedance versus line current :  $ZAL = K \times ZALL + (1 - K) \times ZASL$   
 $K = 1$  for  $I_L = ILL$  ;  $K = 0$  for  $I_L = ISL$ , and  $K$  varies linearly between 1 and 0 when  $I_L$  varies between  $ILL$  and  $ISL$ .

It is possible to use only the standard one sidetone concept by short-circuited Pins SNSL and SNLL.

**Gain Control Inhibition Facility For PABX Application**

( $T_{amb} = 25^{\circ}\text{C}$ ,  $I_L = 20\text{mA}$ ,  $f = 1\text{kHz}$  / No AGC mode selected 0010100)

Symbol	Parameter	Test Conditions	Min.	Typ.	Max.	Unit
Gtp	Transmit Gain	Test 2	Gtl - 3	Gtl - 2	Gtl - 1	dB
Grp	Receive Gain	Test 3	Grl - 3	Grl - 1.4	Grl - 0.5	dB

**LOUDSPEAKER AMPLIFIER PART**

**Loudspeaker Amplifier Channel** ( $T_{amb} = 25^{\circ}\text{C}$ ,  $f = 1\text{kHz}$ ,  $R_{LS} = 50\Omega$ ,  $V_{em} = 0$ )

The Loudspeaker amplifier channel has a maximum gain of 35dB between Pin LSIN and Pin LSOUT. This gain is programmable through the serial bus interface, 7 steps of 4dB each.

To avoid distortion, the output level on the loudspeaker is controlled by a softclipping function, the time constant of this feature is connected to LSSOF pin.

Symbol	Parameter	Test Conditions	Min.	Typ.	Max.	Unit

**LOUDSPEAKER AMPLIFIER PART** (continued)**Antiacoustic Feedback** ( $T_{amb} = 25^{\circ}\text{C}$ ,  $I_L = 20\text{mA}$ , see Test 4)

The antiacoustic feedback system is coupled to the microphone squelch. As soon as the level on the handset microphone is higher than  $V_{T2}$ , the transmit gain increases and the loudspeaker gain decreases. So the transmit and loudspeaker gains are never simultaneously at maximum gain, which reduces larsen effect.

Symbol	Parameter	Test Conditions	Min.	Typ.	Max.	Unit
Dgls(0)	Antiacoustic Feedback Efficiency	Code 0111100	-12	-9.5	-7	dB
Dgls(1)		Code 0111101	-17	-14.5	-12	dB

Dgls(3)		Code 0111111	-26.5	-22.5	-18.5	dB

**Figure 5** : Loudspeaker Gain GLS versus Voltage on Microphone**RING MODE****Loudspeaker Power Supply in Ring Mode** ( $T_{amb} = 25^{\circ}\text{C}$ ,  $R_{LS} = 50\Omega$ , see Test 5)

In ring mode, it is necessary to convert the high voltage / low current power input to a low voltage / high current power, output to be able to drive a  $50\Omega$  loudspeaker, the external switch mode power supply driven by the TEA7092 realizes this feature.

The switch mode power supply, through external component values, fixes the impedance and the start up threshold level.

The volume control in ring mode is the same than the one used in loudspeaking mode for the highest steps, 8 steps of 4dB, and 5 more steps of 4dB each have been added, by using the code 0111011, for the lowest one, by this way the maximum depth in ring mode for the volume control is 48dB.

Symbol	Parameter	Test Conditions	Min.	Typ.	Max.	Unit
I <sub>LEAK1</sub>	Leakage Current	$V_{RING} = 16\text{V}$ , $I(VZP) = 0$		40	150	$\mu\text{A}$

**Ring Frequency**

The frequencies of the ring are given by :  $F_{ring} = \frac{F_i}{n}$ .

$F_i$  can take one of the following values : 19455Hz, 21308Hz, 23551Hz or 26321Hz, and  $n$  varies between 1 and 63.  $F_i$  and  $n$  correspond to 2 codes sent on the serial bus.

**DTMF GENERATOR** ( $T_{amb} = 25^{\circ}\text{C}$ , see Test 3)

Symbol	Parameter	Test Conditions	Min.	Typ.	Max.	Unit

Vlhf	- Loudspeaker Level (Low Frequency)	Code Level (0100111)	-10	-7	-4	dBm
Vhlf	- Loudspeaker Level (High Frequency)		-8	-5	-2	dBm

Unwanted frequencies comply with CEPT 46-03.

**SINE WAVE GENERATOR** ( $T_{amb} = 25^{\circ}\text{C}$ ,  $I_L = 20 \ \& \ 90\text{mA}$ , see Test 3)

The sine wave generator uses the same path than the DTMF generator. Sinus wave frequencies are the half of the DTMF frequencies.

Symbol	Parameter	Test Conditions	Min.	Typ.	Max.	Unit
Sfl	Line Level	Low Frequency Group 348 / 385 / 426 / 470Hz	-18	-14	-10	dBm
Sfh	Line Level	High Frequency Group 604 / 668 / 738 / 816 Hz	-16	-12	-8	dBm

**ERROR BEEP GENERATOR**

The frequencies of the error beep generator are given by :  $F_{EB} = \frac{F_i}{n}$ .

$F_i$  can take one the following values : 19455Hz, 21308Hz, 23551Hz or 26321Hz, and  $n$  varies between 1 and 63.

Error beep generator code generates square wave signal in the earphone.

Error beep generator code following by group listening code generate square wave signal in the earphone and in the loudspeaker.

**MICROCONTROLLER INTERFACE (continued)**

**Serial Bus Interface (data and clock)**

The serial bus uses 7 bits, a standard 8 bit word can be sent, the TEA7092 take care only of the seven first bits.

The different codes are :

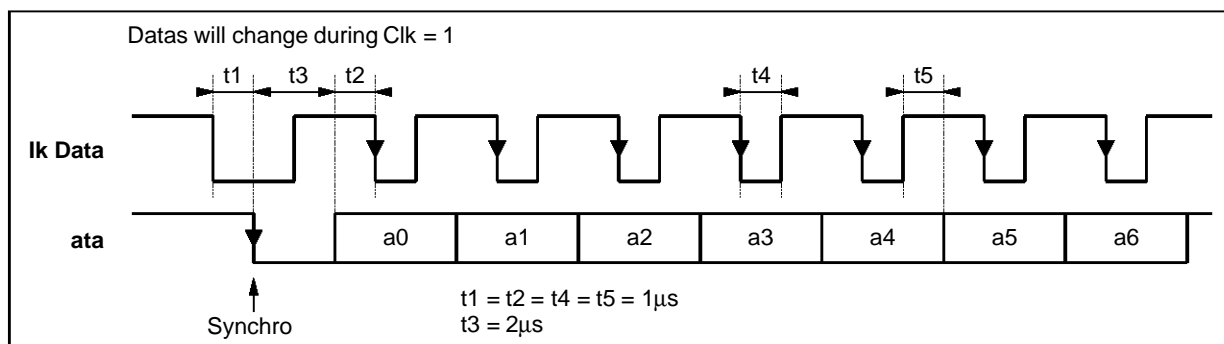

- The ring start up code
- The ring frequency control code
- The mode codes :
  - Handset mode
  - Group listening mode
  - Handsfree mode
- The operating codes (these codes are used under each code mode) :
  - Speech
  - Dialing
  - Microphone mute
  - Earphone/Microphonemute
  - Error beep
  - Sine wave high frequency
  - Sine wave low frequency
- The data codes (DTMF, sinus wave, ring frequency, error beep frequency codes) :  
 These data codes are stored inside the TEA7092 and are used as soon as an operating code is sent, dialing, error beep, sine wave or ring melody control or ring start up code.
- The configuration codes (those codes are "flip-flop" codes) :
  - AGC/no AGC
  - No mask / mask

- Normal gain/normal gain +6dB, on receive channel
- Two sidetone network/one sidetone network
- Squelch/No squelch
- Line current variation initialization (No transfer/Transfer)
- Minus 21dB in Ring Mode
- Minus 6dB in Sending Mode
- Oscillator Stand-by

For instance : The first time that the +6dB code is sent, the receive gain increases of +6dB. If it is sent again, the receive gain goes back to normal value.

- The loudspeaker level control codes
- The reset code to initialize the TEA7092 and to set the reset output to "0" low logic level
- The Init code to initialize the TEA7092, software initialization to set the TEA7092 in the start up condition.
- The start up condition of the TEA7092 is :
  - Handset mode.
  - Speech.
  - No mask.
  - AGC in transmit and receive channels.
  - Normal gain on receive channel.
  - Squelch on transmit channel.
  - Two sidetone networks.
  - No transfer.
  - Oscillator ON.
  - PON line threshold current : 12mA.
  - Anti-acoustic feed-back attenuation : 15dB.

**Figure 8 : 7 Bit Codes Data and Clock Input Timing**

**MICROCONTROLLER INTERFACE (continued)**

**HFIN Input Selection**

For answering machine or cordless connection it can be requested to select HFIN input without enabling the loudspeaker. For this the following procedure should be sent :

- Handsfree code 0110010.
- Tx & Rx mutes 0010010.
- HFIN input select 0110111.

To go back to handsfree mode, send :

- Speech code 0010000.

To go back to handset mode, send :

- Speech code 0010000.
- Handset code 0110000.

**The Loudspeaker Control Code**

Codes							Remarks
a6	a5	a4	a3	a2	a1	a0	
0	1	0	0	0	0	0	Gmax -28dB
0	1	0	0	0	0	1	Gmax -24dB

0	1	0	0	1	1	0	Gmax -4dB
0	1	0	0	1	1	1	Gmax

Loudspeaker Level Control

**The Data Codes**

These codes are used in three different ways, depending of the operating code sent after the data codes :

- In DTMF dialing : Data code+Dialing code
- In Single sine wave : Data code+Sine wave high frequencies (or Sine wave low frequencies)
- In Ring mode, to program the Fi parameter, the Data code is following by the divider code n. Fi and n codes fix the ring output frequency.

Codes							DTMF Dialing Mode		Sine Wave Generator	Fi
a6	a5	a4	a3	a2	a1	a0	Key	DTMF Frequencies		
0	0	0	0	0	0	0	"2"	1336Hz + 697Hz	348 or 604Hz	19455Hz
0	0	0	0	0	0	1	"1"	1209Hz + 697Hz		
0	0	0	0	0	1	0	"A"	1633Hz + 697Hz		
0	0	0	0	0	1	1	"3"	1477Hz + 697Hz		
0	0	0	0	1	0	0	"8"	1336Hz + 852Hz		
0	0	0	0	1	0	1	"7"	1209Hz + 852Hz		
0	0	0	0	1	1	0	"C"	1633Hz + 852Hz		
0	0	0	0	1	1	1	"9"	1477Hz + 852Hz	426 or 738Hz 385 or 668Hz	23551Hz 21308Hz
0	0	0	1	0	0	0	"5"	1336Hz + 770Hz		
0	0	0	1	0	0	1	"4"	1209Hz + 770Hz		
0	0	0	1	0	1	0	"B"	1633Hz + 770Hz		
0	0	0	1	0	1	1	"6"	1477Hz + 770Hz	470 or 816Hz	26321Hz
0	0	0	1	1	0	0	"0"	1336Hz + 941Hz		
0	0	0	1	1	0	1	"*"	1209Hz + 941Hz		
0	0	0	1	1	1	0	"D"	1633Hz + 941Hz		
0	0	0	1	1	1	1	"#"	1477Hz + 941Hz		

## MICROCONTROLLER INTERFACE (continued)

1100111	39	674.9	603.9	546.4	498.8	1111111	63	417.8	373.8	338.2	308.8

If requested, the high frequencies corresponding to n varied between 1 to 15 or Divider codes 100XXXX are accessible.

**Operating Modes**

The TEA7092 can work in 1 of the 3 modes :

- Handset,
- Group listening,
- Handsfree.

In each mode the operating codes determine the operations held by the circuit as soon as this code is received :

For instance DTMF dialing begins as soon as the dialing code is received.

The configuration codes operate in each mode of operation : for instance if the No AGC code is sent, the AGC inhibition will work in the 3 modes : Handset, Group listening and Handsfree.

**DTMF Dialing**

To dial in DTMF the following code sequence is sent :

- DTMF : 000XXXX.
- Dialing code : 0010001.
- Mute or SPEECH code : 0010010 or 0010000 (to end DTMF mode).

The duration of the DTMF signal is fixed by the

duration between DIALING code and MUTE or SPEECH code

**Note** : DTMF code automatically mutes the microphone.

**Sine Wave Codes**

To generate a melody the following sequence of codes is sent :

- Frequency code : 000XXXX.
- SINE WAVE code : 0011101 or 0011110 (low or high frequency).
- SPEECH code : 0010000 (to end SINE WAVE mode).

The duration of the melody is being set by the duration between SINE WAVE code and SPEECH code.

**Note** : SINE WAVE code automatically mutes the microphone.

**PULSE Dialing**

The pulse dialing function is performed by the microcontroller through the high voltage stage.

The voltage over the TEA7092 during dialing can be reduced by sending the MASK code 0010101.

To recover the normal speech voltage at the end of dialing the mask code must be sent again.

**MICROCONTROLLER INTERFACE (continued)**

**RING Mode**

- Ring frequency generator :  
In ring mode, to generate the ring melody in the loudspeaker, the following sequence is sent :
  - LOUDSPEAKER LEVEL : 0100XXX.
  - Fi DATA : 000XXXX.
  - DIVIDER DATA : 1XXXXXX.
  - GROUP LISTENING CODE : 0110001.
  - RING START : 0010001.
  - SPEECH : 0010000 (To stop the ring mode when off-hook is detected, PON = 1).

To change the ring frequency only Fi data and divider data are sent again.

- Ring indicator input (RI/VI) :  
In ring mode the TEA7092 generates a high logic level on pin RI/VI, as soon as the voltage on pin RSU is higher than 19V, and the voltage on pin VRMC is higher than 2.6V. When the voltage on pin VRMC is higher than 2.6V, the RESET output goes high.

**Ring Melody Control**

The melody can be checked in off-hook by sending the following sequence of codes :

- LOUDSPEAKER LEVEL : 0100XXX.
- Fi data : 000XXXX.
- DIVIDER data : 1XXXXXX.
- RING MELODY CONTROL : 0110011.

To change the melody or the level, only loudspeaker level, Fi data and n divider data have to be sent. To stop the ring melody, a speech code 0010000 is sent.

**Error Beep**

Error beep could be used to signalize wrong operations (memory empty, re-dial empty, store too many digits in a memory...) or for other procedures, like melody. To generate the error beep, the following sequence of codes is sent :

- Fi data : 000XXXX.
- DIVIDER data : 1XXXXXX.
- ERROR BEEP code : 0011100.

To stop the error beep a speech code 0010000 is sent. The error beep is a square wave sent on the earphone, if it is requested to send it also in the loudspeaker, the Group listening code should also be sent.

**Line Current Variation Detection**

The TEA7092 has a line current variation detector. This feature memorizes the line current value. When the transfer request code is sent, and if a the current inside the TEA7092 decreases of 15% or more of the line current value, due for example to a telephone set off-hooked in parallel on the same line, the output RI/VI goes HIGH to prevent the associated microcontroller. Oscillator should be ON, and it is preferable to mute the transmit and receive paths to avoid current variation due to ac signals.

- TRANSFER REQUEST : 0011010.

If the Transfer request code is sent again, the current memorization is disabled.

**Figure 9 : Time Diagram of Transfer Request**
