

18 - 20 GHz 5-Bit Phase Shifter

TGC1439A-EPU

The TriQuint TGC1439A-EPU is a 5-Bit Digital Phase Shifter MMIC design using TriQuint's proven 0.5 μ m Power pHEMT process to support a variety of K-Band phased array applications including satellite communication systems.

The 5-bit design utilizes a compact topology that achieves a 1.27 mm² die area, high performance and good tolerance to control voltage variation

The TGC1439A provides a 5-Bit digital phase shift function with a nominal -5 dB insertion loss and 3° RMS phase shift error over a bandwidth of 18-20 GHz.

The TGC1439A requires a minimum of off-chip components and operates with a -5.0 V to -2.5 V control voltage range. Each device is RF tested on-wafer to ensure performance compliance. The device is available in chip form.

Key Features and Performance

- 0.5um pHEMT Technology
- 18-20 GHz Frequency Range
- 3° Typical RMS Phase Shift Error
- -5 dB Typical Insertion Loss
- Control Voltage: -2.5 V to -5.0 V
- Compact 1.27 mm² Die Area

Primary Applications

- Phased Arrays
- Satellite Communication Systems

Symbol	Parameter	Value	Notes
V ⁻	Control Voltage	-8 V	
I ⁺	Control Current	1 mA	3/
P _D	Power Dissipation	0.1 W	
P _{IN}	Input Continuous Wave Power	20 dBm	
T _{CH}	Operating Channel Temperature	150 °C	1/, 2/
T _M	Mounting Temperature (30 seconds)	320 °C	
T _{STG}	Storage Temperature	-65 °C to 150 °C	

- 1/ These ratings apply to each individual FET
- 2/ Junction operating temperature will directly affect the device mean time to failure (MTTF). For maximum life it is recommended that junction temperatures be maintained at the lowest possible levels.
- 3/ Total current for the entire MMIC

Chip Assembly and Bonding Diagram

Reflow process assembly notes:

- AuSn (80/20) solder with limited exposure to temperatures at or above 300°C
- alloy station or conveyor furnace with reducing atmosphere
- no fluxes should be utilized
- coefficient of thermal expansion matching is critical for long-term reliability
- storage in dry nitrogen atmosphere

Component placement and adhesive attachment assembly notes:

- vacuum pencils and/or vacuum collets preferred method of pick up
- avoidance of air bridges during placement
- force impact critical during auto placement
- organic attachment can be used in low-power applications
- curing should be done in a convection oven; proper exhaust is a safety concern
- microwave or radiant curing should not be used because of differential heating
- coefficient of thermal expansion matching is critical

Interconnect process assembly notes:

- thermosonic ball bonding is the preferred interconnect technique
- force, time, and ultrasonics are critical parameters
- aluminum wire should not be used
- discrete FET devices with small pad sizes should be bonded with 0.0007-inch wire
- maximum stage temperature: 200°C

GaAs MMIC devices are susceptible to damage from Electrostatic Discharge. Proper precautions should be observed during handling, assembly and test.
