SIEMENS

5-V Low-Drop Fixed Voltage Regulator

TLE 4279

Features

- Output voltage tolerance ≤ ± 2 %
- Very low current consumption
- Early warning
- Reset output low down to V_Q = 1 V
- Overtemperature protection
- Reverse polarity proof
- Settable reset threshold
- Very low-drop voltage
- Wide temperature range

Functional Description

This device is a voltage regulator with a fixed 5-V output, e.g. in a P-DSO-8-1 package. The maximum operating voltage is 45 V. The output is able to drive a 150 mA load. It is short circuit protected and the thermal shutdown switches the output off if the junction temperature is in excess of 150 °C. A reset signal is generated for an output voltage of V_Q < 4.6 V. The reset threshold voltage can be decreased by external connection of a voltage divider. The reset delay time can be set by an external capacitor. If the application requires pull up resistors at the logic outputs (Reset, Sense Out) the TLE 4269 with integrated resistors can be used. It is also possible to supervise the input voltage by using an integrated comparator to give a low voltage warning.

Pin Configuration

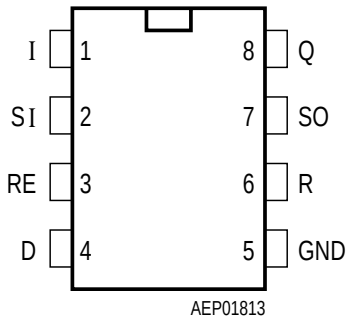
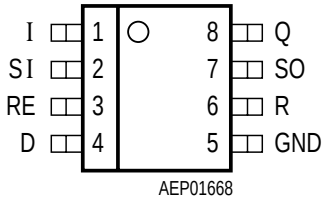
P-DIP-8-4



P-DSO-8-1



Pin Definitions and Functions (TLE 4279 A and TLE 4279 G)

Pin No.	Symbol	Function
1	I	**Input;** block directly to GND on the IC with a ceramic capacitor.
2	SI	**Sense input;** if not needed connect to Q.
3	RE	**Reset threshold;** if not needed connect to ground.
4	D	**Reset delay;** to select the delay time, connect to GND via external capacitor.
5	GND	Ground
6	R	**Reset output;** open-collector output
7	SO	**Sense output;** open-collector output
8	Q	**5-V output;** connect to GND with a 10 µF capacitor, ESR < 10 Ω.

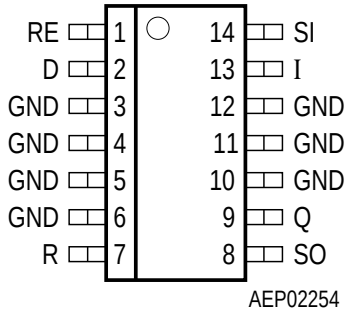
P-DSO-14-4



Pin Definitions and Functions (TLE 4279 GM)

Pin No.	Symbol	Function
1	RE	**Reset threshold;** if not needed connect to GND
2	D	**Reset delay;** connect to GND via external delay capacitor for setting delay time
3, 4, 5, 6	GND	**Ground**
7	R	**Reset output;** open-collector output
8	SO	**Sense output;** open-collector output
9	Q	**5-V output;** connect to GND with 10 µF capacitor, ESR < 10 Ω
10, 11, 12	GND	**Ground**
13	I	**Input;** block to ground directly at the IC by a ceramic capacitor
14	SI	**Sense input;** if not needed connect to Q

Circuit Description

The control amplifier compares a reference voltage, made highly accurate by resistance balancing, with a voltage proportional to the output voltage and drives the base of the series PNP transistor via a buffer. Saturation control as a function of the load current prevents any over-saturation of the power element.

In the reset generator block a comparator compares a reference voltage independent of the input voltage with the scaled-down output voltage. If the output voltage reaches 4.6 V the reset delay capacitor is discharged and the reset output is set to low. This low is guaranteed down to an output voltage of 1 V. As the output voltage increases again, from 4.6 V onward the reset delay capacitor is charged with constant current. When the capacitor voltage reaches the upper switching threshold V_{dt}, the reset returns to high. By choosing the value of this capacitor, the reset delay time can be selected over a wide range. With the reset threshold input RE it is possible to lower the reset threshold V_{rt}. If pin RE is connected to pin Q via a voltage divider, for example, the reset condition is reached when this voltage is decreased below the switching threshold V_{re} of 1.35 V.

Another comparator compares the signal of the pin SI, normally fed by a voltage divider from the input voltage, with the reference and gives an early warning on the pin SO. It is also possible to superwise an other voltage e.g. of a second regulator, or to build a watchdog circuit with few external components.

Application Description

The input capacitor C_I is necessary for compensating line influences. Using a resistor of approx. 1 Ω in series with C_I, the oscillating circuit consisting of input inductivity and input capacitance can be damped. The output capacitor C_Q is necessary for the stability of the regulating circuit. Stability is guaranteed at values ≥ 10 µF and an ESR ≤ 10 Ω within the operating temperature range. Both reset output and sense output are open collector outputs and have to be connected to 5 V output via external pull-up resistors ≥ 10 kΩ. For small tolerances of the reset delay the spread of the capacitance of the delay capacitor and its temperature coefficient should be noted.
