DESCRIPTION

The TPB series are TRISIL devices especially designed for protecting sensitive telecommunication equipment against lightning and transient voltages induced by AC power lines. They are available in the CB429 axial package.

TRISIL devices provide bidirectional protection by crowbar action. Their characteristic response to transient overvoltages makes them particularly suited to protect voltage sensitive telecommunication equipment.

Note 1: I_R measured at V_R guarantees $V_{BRmin} \geq V_R$

Note 3: See test circuit 2.

Note 2: Measured at 50 Hz (1 cycle) - See test circuit 1.

Note 4: $V_R = 1\text{V}$, $F = 1\text{MHz}$, refer to fig.3 for C versus V_R

TEST CIRCUIT 1 FOR I_{BO} and V_{BO} parameters:

TEST CIRCUIT 2 for I_H parameter

This is a GO-NO GO test which allows to confirm the holding current (I_H) level in a functional test circuit.

TEST PROCEDURE :

- Adjust the current level at the I_H value by short circuiting the D.U.T.
- Fire the D.U.T. with a surge current : $I_{pp} = 10A$, $10/1000 \mu s$.
- The D.U.T. will come back to the off-state within 50 ms max.
