

## LINEAR INTEGRATED CIRCUIT

# HIGH PERFORMANCE CURRENT MODE CONTROLLERS

### DESCRIPTION

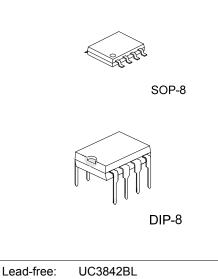

The UTC **UC3842B/3843B** are specifically designed for off-line and dc-to-dc converter applications offering the designer a cost-effective solution with minimal external components.

The **UC3842B** has UVLO thresholds 16V (on) and 10V(off), ideally suited for off-line converters. The **UC3843B** is tailored for lower voltage applications having UVLO thresholds of 8.4V(on) and 7.6V(off).

### FEATURES

- \* Trimmed oscillator for precise frequency control
- \* Oscillator frequency guaranteed at 250kHz
- \* Current mode operation to 500kHz
- \* Automatic feed forward compensation
- \* Latching PWM for cycle-by-cycle current limiting
- \* Internally trimmed reference with undervoltage lockout
- \* High current totem pole output
- \* Undervoltage lockout with hysteresis
- \* Low startup and operating current

### ORDERING INFORMATION

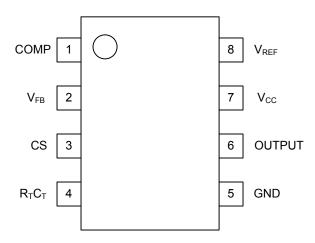

UC3843BL Halogen-free: UC3842BP UC3843BP

## ■ PIN CONFIGURATION

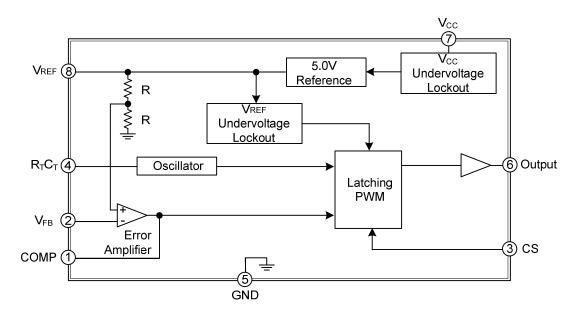

### ■ PIN DESCRIPTIONS

PIN NO.	PIN NAME	I/O	DESCRIPTION
1	COMP	0	Error amp output to provide loop compensation maintaing $V_{FB}$ at 2.5V
2	$V_{FB}$	Ι	Error amp inverting input, The non-inverting input of error amp is 2.5V band gap reference
3	CS	I	Current sense input to PWM control gate drive of output
4	R <sub>T</sub> C <sub>T</sub>	I	To set oscillator frequency and maximum output duty cycle
5	GND		Power ground
6	OUTPUT	0	To direct drive power MOSFET
7	V <sub>CC</sub>		Power supply
8	V <sub>REF</sub>	0	5V regulated output provides charging current for $C_T$ through $R_T$

### BLOCK DIAGRAM

#### ■ ABSOLUTE MAXIMUM RATINGS(Ta=25°C)

PARAMETER		SYMBOL	RATINGS	UNIT
Total Power Supply and Zener Current		$(I_{CC} + Iz)$	30	mA
Output Current, Source or Sink (note1)		lo	1.0	А
Output Energy (capacitive load per cycle)		W	5.0	μJ
Current Sense and Voltage Feedback Inputs		V <sub>IN</sub>	-0.3 ~ +5.5	V
Error Amp. Output Sink Current		I <sub>O(SINK)</sub>	10	mA
Power Dissinction	DIP-8	<b>D</b>	1250	mW
Power Dissipation	SOP-8	P <sub>D</sub>	702	mW
Operating Junction Temperature		TJ	+150	°C
Operating Temperature		T <sub>OPR</sub>	0 ~ +70	°C
Storage Temperature Range		T <sub>STG</sub>	-65 ~ +150	°C

Note Absolute maximum ratings are those values beyond which the device could be permanently damaged. Absolute maximum ratings are stress ratings only and functional device operation is not implied.

#### THERMAL DATA

PARAMETER		SYMBOL	RATINGS	UNIT
The second Desistences have the Archievet	DIP-8	θ <sub>JA</sub>	100	°C/W
Thermal Resistance Junction to Ambient	SOP-8		178	°C/W

### ELECTRICAL CHARACTERISTICS

 $(0^{\circ}C \le T_A \le 70^{\circ}C, V_{CC} = 15V \text{ [note 2]}, R_T = 10k, C_T = 3.3nF, unless otherwise specified)$

Min. Operating Voltage After	V <sub>CC(MIN)</sub>	UTC UC3842B	8.5		11.5	V
Turn-on(Vcc)		UTC UC3843B	7.0	7.6	8.2	V
PWM SECTION		·				
MAX	50		94	96		%
Duty Cycle MIN	DC				0	%
Total DEVICE						
Power Startup Supply Current	I <sub>CC</sub> +I <sub>C</sub>	V <sub>CC</sub> =6.5V for UC3843B V <sub>CC</sub> =14V for UC3842B		0.3	0.5	mA
Power Operating Supply Current	I <sub>cc</sub> +I <sub>c</sub>	Note2		12	17	mA
Power Supply Zener Voltage	V <sub>Z</sub>	I <sub>cc</sub> =25mA	30	36		V
Power Supply Zener Voltage		· · · ·	30	36		V

Note: 1. Maximum Package power dissipation limits must be observed.

2. Adject  $V_{\mbox{\scriptsize CC}}$  above the Startup threshold before setting to 15V.

3. This parameter is measured at the latch trip point with  $V_{\text{FB}}\text{=}0\text{V}.$ 

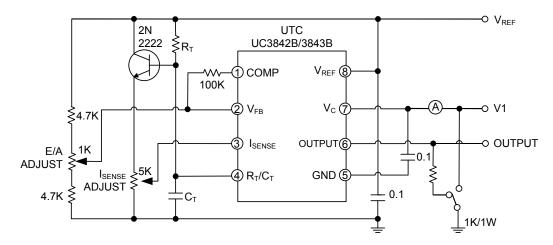

4. Comparator gain is defined as :  $G_V \frac{\Delta V \text{ Output Compensation}}{\Delta V \text{ Current Sense Input}}$ 

### TYPICAL APPLICATION CIRCUIT

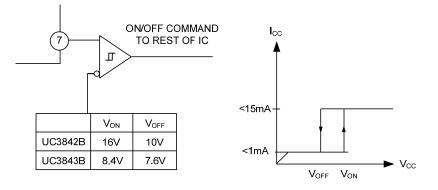

#### **Open Loop Test Circuit**

All of the parameters are not all tested in production, although been guaranteed. The timing and bypass capacitors must be connected to pin 5 in a single point ground very closely. To sample the oscillator waveform, the transistor and  $5k\Omega$  potentiometer are used, and also can apply an adjustable ramp to I<sub>SENSE</sub> pin.

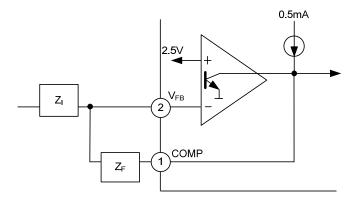

#### Under Voltage Lockout

Under-Voltage Lock-Out: the output driver is biased to a high impedance state. To prevent activating the power switch with output leakage current, pin 6 should be shunted to ground with a bleeder resistor.

Error Amp Configuration

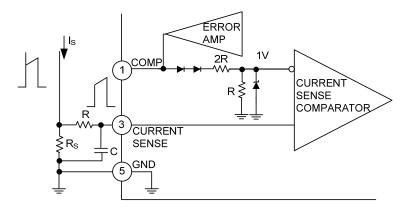

Error amp can source sink up to 0.5mA

#### APPLICATION INFORMATION(Cont.)

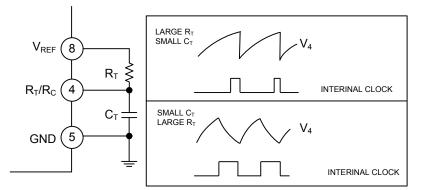

#### **Current Sense Circuit**

## Peak current ( $I_S$ ) is equaled: $I_{S(MAX)}=1.0V/R_S$

There should be a small RC filter to suppress switch transients.

#### **Oscillator Waveforms and Maximum Duty Cycle**

 $C_T$  (Oscillator timing capacitor) can be charged by  $V_{REF}$  through  $R_T$  and discharged by an internal current source. At discharge time, the internal clock signal blanks the output to the low. Both oscillator frequency and maximum duty cycle can be determined by Selection of  $R_T$  and  $C_T$ . All charge and discharge times can be calculated by the next formulas:

 $t_C$ =0.55 R<sub>T</sub> C<sub>T</sub>

 $t_{D} = R_{T}C_{T}I_{n}\left(\frac{0.0063R_{T} - 2.7}{0.0063R_{T} - 4}\right)$ 

#### APPLICATION INFORMATION(Cont.)

Shutdown Techniques

The UTC **UC3842B's** shutdown can be accomplished by two ways: raise pin 3 above 1V; or pull pin 1 below a voltage two diode drops above ground. Either method can cause the PWM comparator's output to be high. Because the PWM latch is reset dominant, the output will remain low until the next clock cycle after the shutdown condition at pins 1 and/or 3 is removed.
