

Fail-Safe, Single Supply RS-232 Transceivers***UM3221E/UM3222E/UM3232E*****General Description**

The UM3221E/UM3222E/UM3232E series are 3.3V powered RS-232 transceivers intended for portable or hand-held applications. The UM3221E has one driver/one receiver while the UM3222E/UM3232E has two drivers/two receivers. The device features low power consumption, high data-rate capability and enhanced ESD protection. The ESD rating of all transmitter outputs and receiver inputs is $\pm 15\text{kV}$ for both human body mode and IEC61000-4-2 air discharge methods, and over $\pm 8\text{kV}$ for IEC61000-4-2 contact discharge methods. The logic I/O pins are protected to $\pm 2\text{kV}$ for human body mode.

Small footprint, low profile package and the use of small $0.1\mu\text{F}$ capacitors ensure board space savings as well. Data rates greater than 250kbps are guaranteed at worst case load conditions. This family is fully compatible with 3.3V-only systems, mixed 1.8V and 3.3V systems, mixed 3.3V and 5.0V systems and 5.0V-only systems.

The UM3221E/UM3222E has a low-power shutdown mode where the devices' driver outputs and charge pumps are disabled. During shutdown, the supply current falls to less than $1\mu\text{A}$ that reduces power consumption in battery-powered portable systems or other low power consumption systems. The UM3221E/UM3222E receivers remain active in shutdown mode, allowing monitoring of external signals.

The UM3221E/UM3222E and UM3232E are pin, package, and functionally compatible with the industry standard MAX242 and MAX 232, respectively.

Applications

- Industrial Automation Equipments
- Battery-Powered Equipments
- Hand-Held Equipments
- POS Terminals

Features

- Meets True EIA/TIA-232-F Standards from a +3.0V to +5.5V Power Supply
- Meets EIA/TIA-562 Levels of $\pm 3.7\text{V}$ with Supply Voltages as Low as 2.7V
- Enhanced ESD Specifications:
 - $\pm 15\text{kV}$ Human Body Mode
 - $\pm 15\text{kV}$ IEC61000-4-2 Air Discharge Mode
 - $\pm 8\text{kV}$ IEC61000-4-2 Contact Discharge Mode
- $1\mu\text{A}$ Low Power Shutdown (UM3221E/UM3222E)
- 250kbps Minimum Transmission Rate
- Guaranteed $30\text{V}/\mu\text{s}$ Max Slew Rate
- Latch-Up Performance Exceeds 200mA
- Hot Swap and Fail-Safe
- I/O Logic Compatible with 1.8V Logic @ $V_{\text{CC}}=3.3\text{V}$

Detailed Description

Dual Charge-Pump Voltage Converter

The UM3221E/UM3222E/UM3232Es' internal power supply consists of a regulated dual charge pump and provides output the maxim voltages of +7V (doubling charge pump) and -7V (inverting charge pump) over the +3.0V to +5.5V V_{CC} range. The charge pump operates in discontinuous mode; if the output voltages are less than 7V, the charge pump is enabled, and if the output voltages exceed 7V, the charge pump is disabled. The charge pumps require only four small, external 0.1 μ F capacitors for the voltage doubler and inverter functions (see Figure 2).

RS-232 Transmitters

The transmitters are inverting level translators that translate TTL/CMOS inputs to EIA/TIA-232 output levels. All UM3221E/UM3222E/UM3232E transmitters guarantee a 250kbps data rate for full load conditions (3k Ω and 1000pF). Transmitters can be paralleled to drive multiple receivers.

RS-232 Receivers

The receivers convert RS-232 signals to CMOS output levels and accept inputs up to ± 30 V while presenting the required 3k Ω to 7k Ω input impedance. The UM3221E/UM3222E receivers have inverting three-state outputs. Drive \overline{EN} high to place the receivers into a high impedance state. Receivers can be either active or inactive in shutdown state depending on \overline{EN} status.

UM3221E/UM3222E

Supply current falls to less than 1 μ A in shutdown mode ($\overline{SHDN} = GND$). When shutdown, the device's charge pumps are shut off, $V+$ is pulled down to V_{CC} , $V-$ is pulled to ground, and the transmitter outputs are disabled (high impedance). The time required to recover from shutdown is typically 100 μ s. Connect \overline{SHDN} to V_{CC} if shutdown mode is not used. \overline{SHDN} has no effect on R_{OUT} .

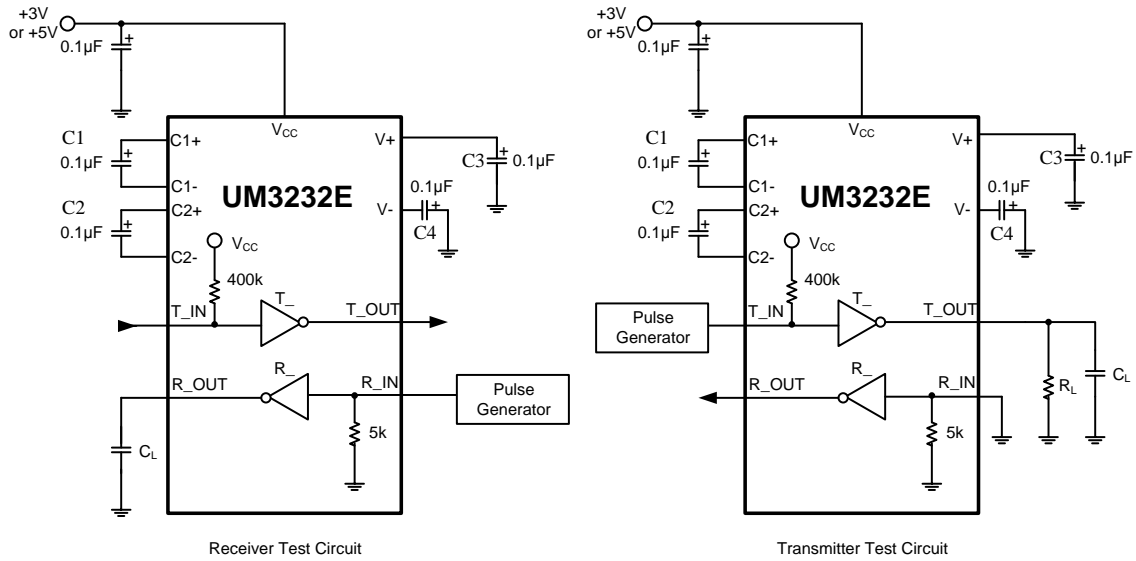

± 15 kV ESD Protection

All pins on UM3221E/UM3222E/UM3232E devices include ESD protection structures, but the family incorporates advanced structures which allow the RS-232 pins (transmitter outputs and receiver inputs) to survive ESD events up to ± 15 kV. The RS-232 pins are particularly vulnerable to ESD damage because they are typically connected to an exposed port on the exterior of the finished product. The ESD structures withstand high ESD in all states: normal operation, shutdown and powered down. After an ESD event, circuits keep working without latch up. ESD protection can be tested in various ways; the transmitter outputs and receiver inputs are characterized for protection to the following limits: ± 15 kV using the Human Body Model, ± 8 kV using the Contact Discharge method specified in IEC61000-4-2, ± 15 kV using the Air-Gap Discharge method specified in IEC61000-4-2. The logic pins are characterized for protection to the following limit: ± 2 kV using the Human Body Model.

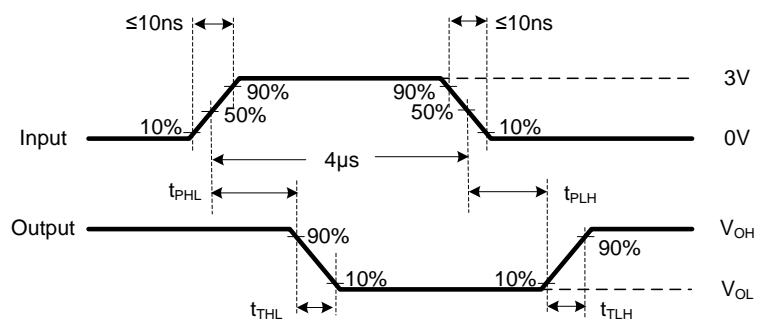

Hot Swap and Fail-Safe

The UM3221E/UM3222E/UM3232E guarantees a logic-high receiver output when the receiver inputs are shorted to GND or open, or when they are connected to a line with no driver enabled. Because of the latch-up characteristics and all sort protection, UM3221E/UM3222E/UM3232E support hot swap.

Typical Operating Circuits

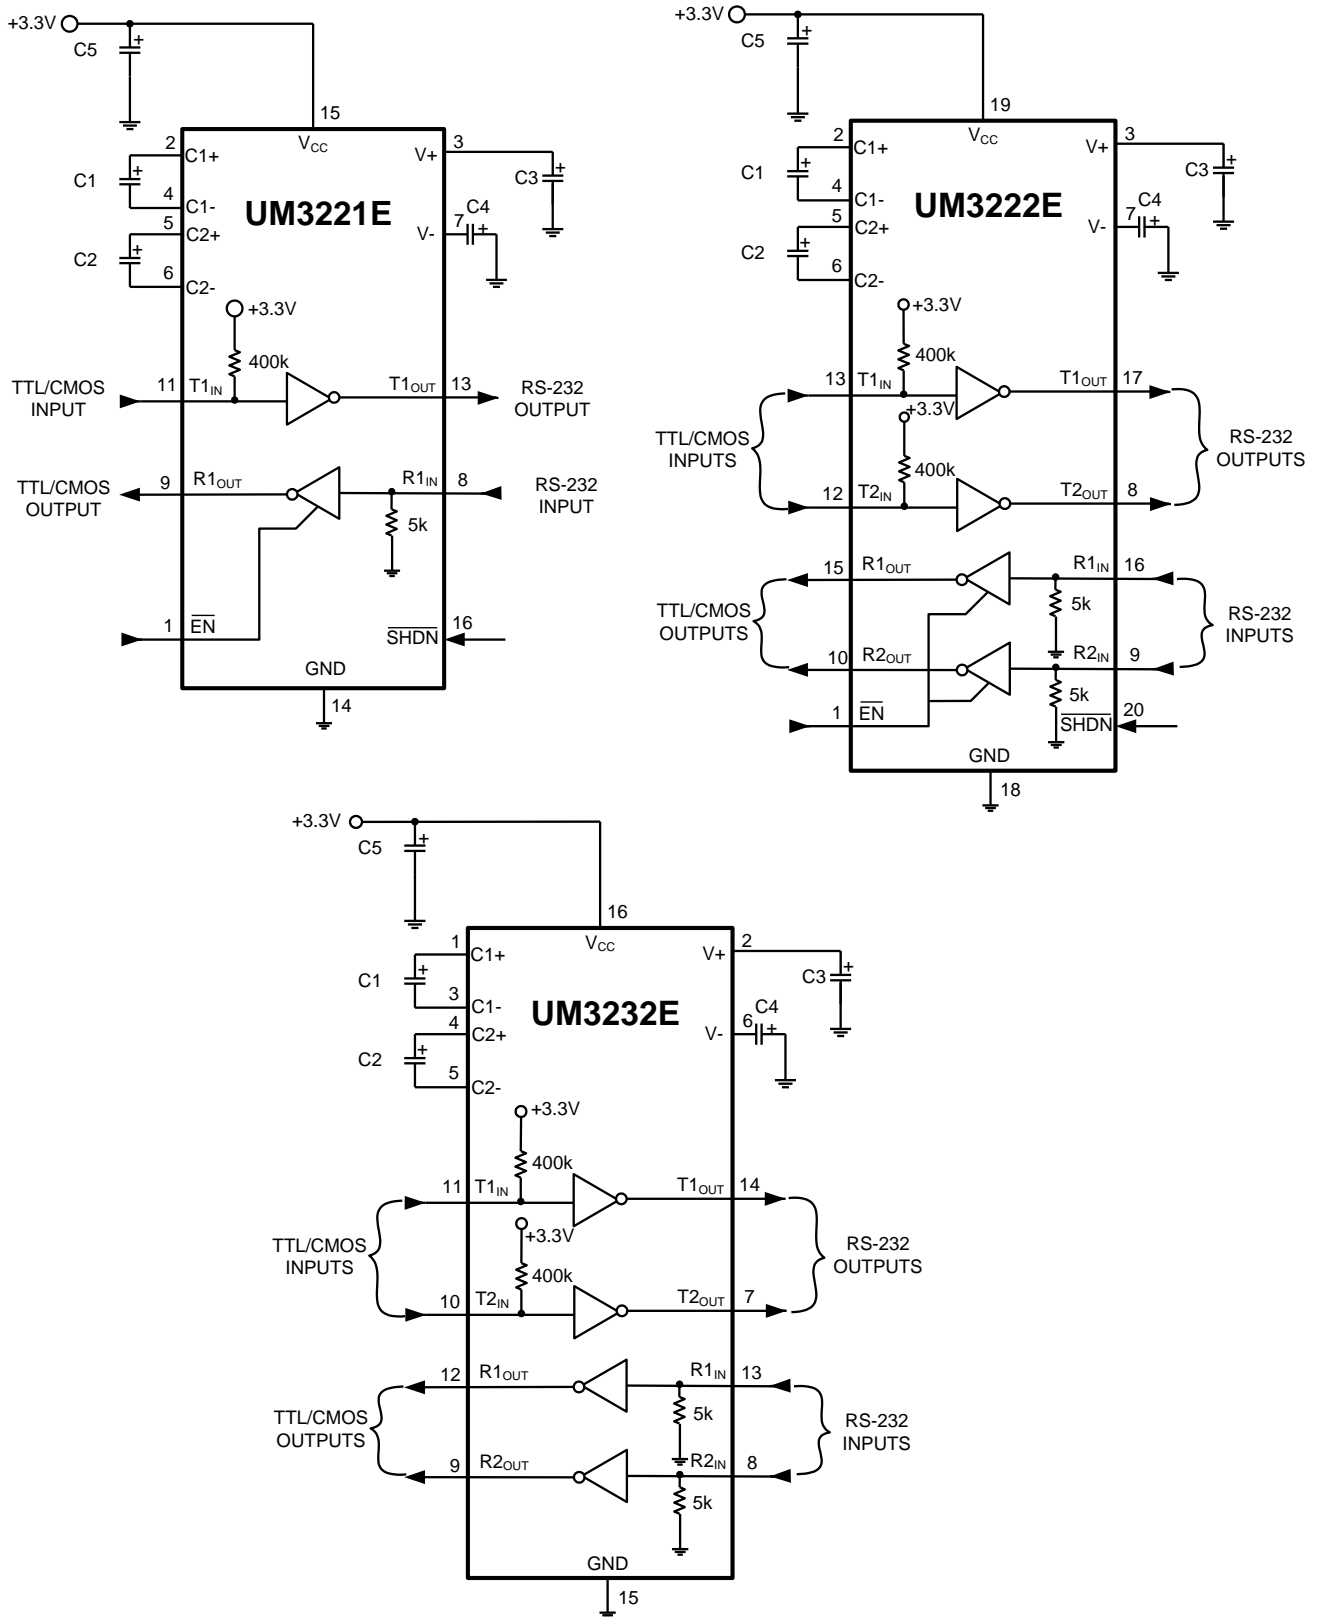

Figure 2

Typical Operating Characteristics

($V_{CC}=+3.3V$, 250kbps data rate, $0.1\mu F$ capacitors, all transmitters loaded with $3k\Omega$ and C_L , $T_A=25^\circ C$, unless otherwise noted.)

Applications Information

Capacitor Selection

The capacitor type used for C1–C4 is not critical for proper operation; polarized or non-polarized capacitors can be used. The charge pump requires 0.1 μ F capacitors for 3.3V operation. Increasing the capacitor values (e.g. by a factor of 2) reduces ripples on the transmitter outputs and slightly reduces power consumption. C2, C3 and C4 can be increased without changing C1's value. When using the minimum required capacitor values, make sure the capacitor value does not degrade excessively with temperature. If in doubt, use capacitors with a larger nominal value. The capacitor's equivalent series resistance (ESR), which usually rises at low temperatures, influences the amount of ripples on V+ and V- output voltages.

The following table shows some recommended minimum required pump capacitor values for different input voltage ranges.

Minimum Required Pump Capacitor Value	
Input Voltage V _{CC}	Charge Pump Capacitor Value for UM32XX
2.7V to 3.6V	C1–C4=0.1 μ F
3.6V to 5.5V	C1–C4=0.47 μ F
2.7V to 5.5V	C1–C4=0.47 μ F

Power Supply Decoupling

In most circumstances, a 0.1 μ F V_{CC} bypass capacitor is adequate. In applications sensitive to power-supply noise, use a capacitor of the same value as charge pump capacitor C1. Connect bypass capacitors to the IC as close as possible.

Operation down to 2.7V

Transmitter outputs meet EIA/TIA-562 levels of \pm 3.7V with supply voltages as low as 2.7V.

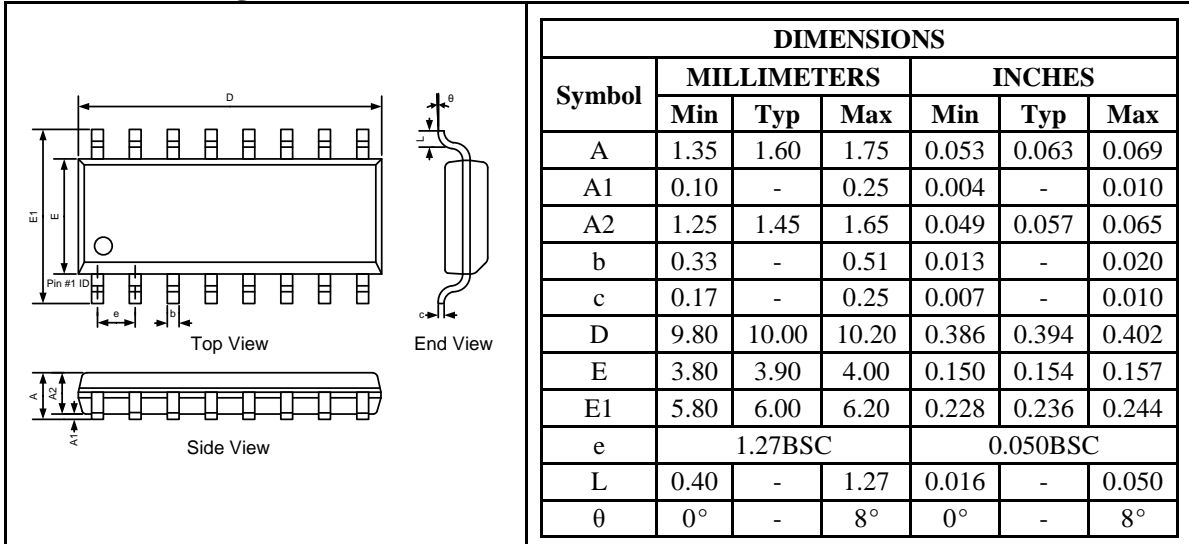

Interconnection with 3V and 5V Logic

The UM3221E/UM3222E/UM3232E can directly interface with various 3V and 5V logic families, including ACT and HCT CMOS.

GREEN COMPLIANCE

Union Semiconductor is committed to environmental excellence in all aspects of its operations including meeting or exceeding regulatory requirements with respect to the use of hazardous substances. Numerous successful programs have been implemented to reduce the use of hazardous substances and/or emissions.

All Union components are compliant with the RoHS directive, which helps to support customers in their compliance with environmental directives. For more green compliance information, please visit:
