

## QUAD Pch HIGH-SIDE SWITCH FOR USB

**DESCRIPTION**

The  $\mu$ PD16874 is a power switch IC with an overcurrent limiter that is used for the power bus of a Universal Serial Bus (USB). This product has Pch power MOSFET circuits, each of which has a low-on resistance (100 m $\Omega$  TYP.), in its switching block.

In addition, the IC is also equipped with an overcurrent detector that is essential for a host/hub controller conforming to the USB Standard, so that the IC can report an overcurrent to the controller. Moreover, a thermal shutdown circuit and an undervoltage lockout circuit are also provided as the protection circuits of the IC.

This product has four channels of power switches, control input pins, and flag output pins to simultaneously control four USB ports with a single IC.

**FEATURES**

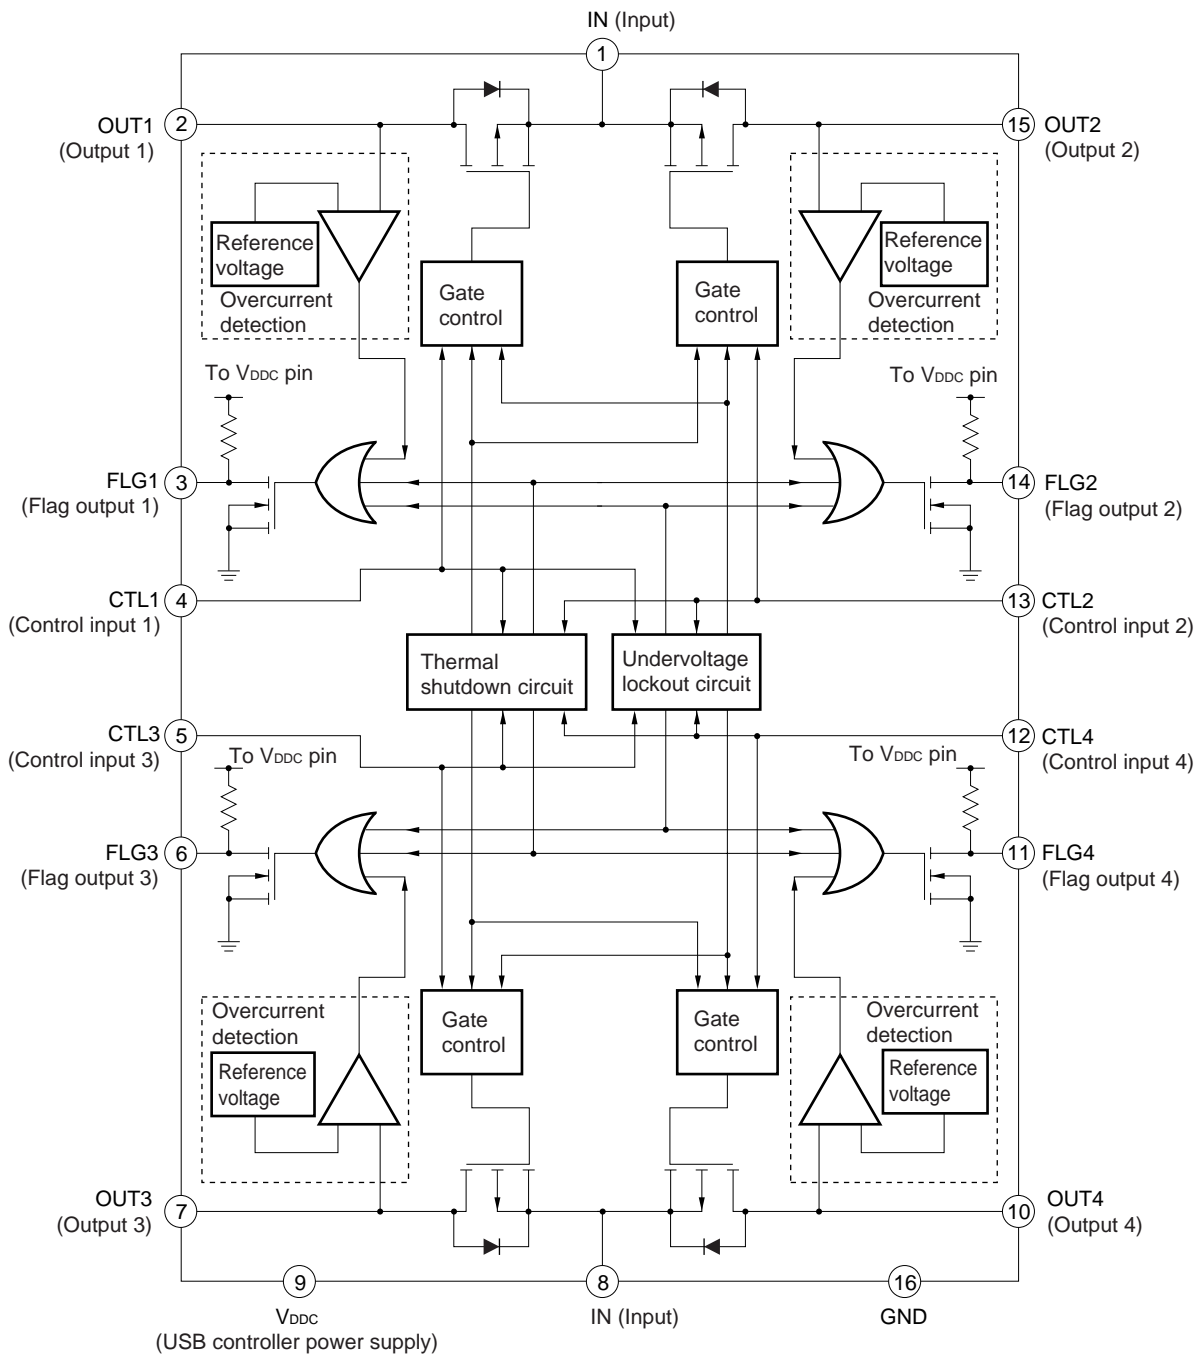

- Four P-ch power MOSFET circuits
- Overcurrent detector that outputs active-low control signal from detection report pin
- Overcurrent limiter to prevent system voltage drop
- Thermal shutdown circuit
- Undervoltage lockout circuit
- Each of four circuits can be turned on and off independently of the others by a control pin. (CTL input: active low)
- 16-pin SOP package

**ORDERING INFORMATION**

Part Number	Package
$\mu$ PD16874GS	16-pin SOP (7.62 mm (300))

The information in this document is subject to change without notice. Before using this document, please confirm that this is the latest version.  
 Not all devices/types available in every country. Please check with local NEC representative for availability and additional information.

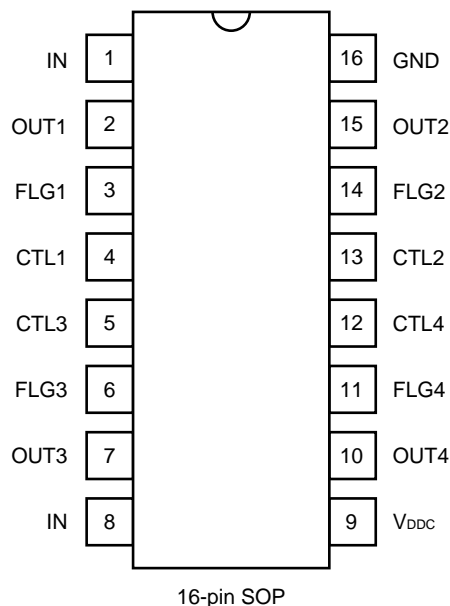

**BLOCK DIAGRAM**

**NOTES ON CORRECT USE**

- No internal resistor is connected to input pins CTL1 (pin 4), CTL2 (pin 13), CTL3 (pin 5), and CTL4 (pin 12). When using the μPD16874, therefore, be sure to set the voltage level of these input pins to “H” or “L”.
- Keep the IN pins (pins 1 and 8) at the same potential.
- Supply a voltage lower than that supplied to the IN pins (pins 1 and 8) to V<sub>DDC</sub> (pin 9).
- FLG1 (pin 3), FLG2 (pin 14), FLG3 (pin 6), and FLG4 (pin 11) are internally pulled up to V<sub>DDC</sub> (USB controller supply voltage) (resistance: approx. 400 kΩ). Therefore, no external pull-up resistor has to be connected to these pins.

**PIN CONFIGURATION (Top View)**

**PIN DESCRIPTION**

Pin No.	Pin Name	Pin Function
4/5/12/13	CTL1/CTL2/CTL3/CTL4	Control input (See the truth table below). TTL input
3/6/11/14	FLG1/FLG2/FLG3/FLG4	Detection flag (output): Active-low, Nch open-drain
16	GND	Ground
1/8	IN	Power input: Source of MOSFET for output. Power supply to internal circuitry of IC
9	V <sub>DDC</sub>	USB controller power supply. Each FLG output is connected via internal resistor.
2/7/10/15	OUT1/OUT2/OUT3/OUT4	Switch output: Drain of MOSFET for output. Usually, connected to load.

**TRUTH TABLE (H: High level, L: Low level, ON: Output on, OFF: Output off, X: H or L)**

CTLn (In)	FLGn (Out)	OUTn (Out)	Operation mode
L	H	ON	OUTn ON
H	H	OFF	OUTn OFF
H (all)	H (all)	OFF (all)	Standby mode
L	L	ON	OUTn overcurrent detection
X	L (all)	OFF (all)	Thermal shutdown circuit operation
X	L (all)	OFF (all)	Undervoltage lockout circuit operation

**ABSOLUTE MAXIMUM RATINGS (Unless otherwise specified, T<sub>A</sub> = 25°C)**

Parameter	Symbol	Conditions	Ratings	Unit
Input voltage	V <sub>IN</sub>		-0.3 to +6	V

**Overcurrent Detection Delay Time/Minimum CTL High Time**

**DESCRIPTION OF FUNCTIONS**

**1. Overcurrent Detection**

This IC detects an overcurrent in a range of 0.6 to 1.25 A (0.9 A TYP.) (the USB Standard defines that an overcurrent is 0.5 A MAX.). When the IC detects an overcurrent, the FLG pin goes low (active) and reports the result of detection to the control IC. At this time, the switch is kept ON and the current limiter is activated. In this way, an overcurrent status that lasts for a long time can be prevented.

By deasserted the CTL pin inactive by the control IC, the switch is turned OFF and the FLG pin goes back high. Therefore, the CTL signal must be deasserted inactive as soon as the controller IC has detected that the FLG pin has gone low, to avoid overheating this IC. Once the switch has been turned OFF, it turns back ON again only when the CTL signal is asserted active while the FLG pin is high.

To prevent an inrush current being detected by mistake, a deadband time (overcurrent detection delay time) is set to elapse before the overcurrent detector is activated. The duration of this deadband time is 20 μs TYP.

While the overcurrent limiter is activated, the power consumption of the device may abruptly increase. As a result, the junction temperature may also rise. Make sure that the CTL signal is deasserted inactive and that the switch is turned OFF before the absolute maximum rating is exceeded.

**2. Undervoltage Lockout Circuit (UVLO)**

This circuit prevents malfunctioning of the switch due to fluctuation in supply voltage.

When power is turned on (2.5 V or less TYP.) or off (2.3 V or less TYP.), the OUT and FLG pins have the following status:

- OUT: OFF
- FLG: "L" (= 0 V)

The above figure does not show the actual waveform. For the related characteristic waveform, refer to Major Characteristic Curves.

### 3. Behavior When Power is Turned ON/OFF

This IC performs a soft-start operation on power application. This is to prevent an overcurrent from flowing through the IC on power application while the high-capacity capacitor connected to the output pin is charged.

Power ON: Soft start (2.5 to 8 ms)

Power OFF: No control (10  $\mu$ s MAX.)

The above figure does not show the actual waveform. For the related characteristic waveform, refer to Major Characteristic Curves.

OPERATION SEQUENCE

Power ON/OFF

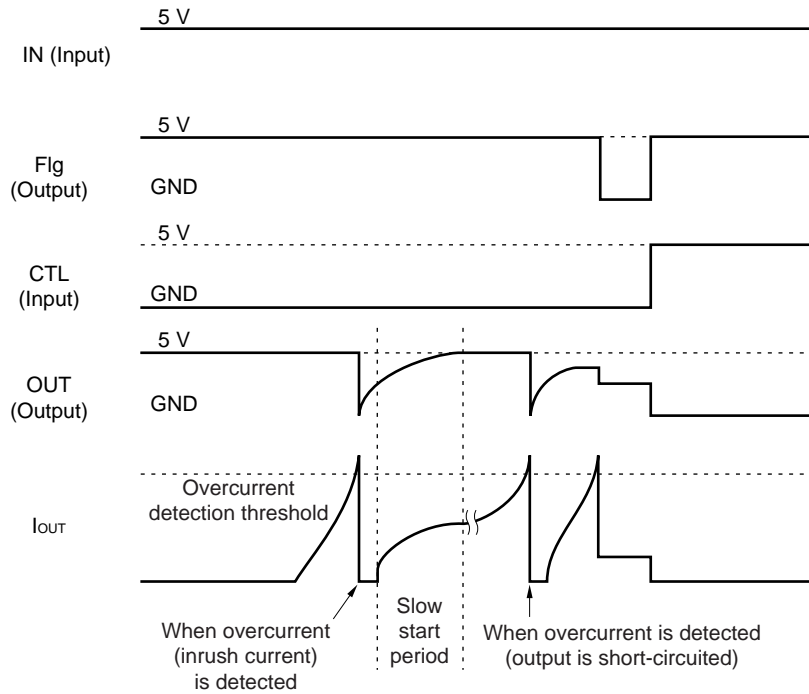

**Note** If the CTL signal is asserted active after power has been turned ON, OUT executes the soft-start operation (output transition time: 8 ms MAX.). In addition, FLG output is fixed to “L” if the supply voltage is lower than the operating voltage of the undervoltage lockout circuit (UVLO) on power application. If all the CTL pins are inactive when power is supplied, the IC enters the standby status (IDD = 5 μA MAX.).

When Control Signals Are Input

**On Detection of Overcurrent**

If an overcurrent is detected after the overcurrent detection delay time of 20 μs, the IC executes a slow-start operation again.

If an overcurrent is detected while the IC is executing the slow-start operation again, it is assumed that the output is short-circuited and the FLG pin goes low. When the CTL signal is deasserted inactive, OUT is turned OFF and FLG goes high. If the CTL signal is asserted active, OUT is turned back ON unless the undervoltage lockout circuit or thermal shutdown circuit is activated.

**When Thermal Shutdown Circuit Operates**

While the thermal shutdown circuit is activated, the output pins are in the OFF status. However, the IC does not enter the standby status even if all the CLT pins are deasserted inactive at the same time.

The thermal shutdown circuit is not activated even if the junction temperature exceeds 150°C TYP. while the IC is in the standby mode (when all the CTL pins are inactive).

**RECOMMENDED SOLDERING CONDITIONS**

The μPD16874 should be soldered and mounted under the following recommended conditions.  
 For soldering methods and conditions other than those recommended, contact your NEC sales representative.

**Surface Mount Type**

For the details of the recommended soldering conditions, refer to the document **Semiconductor Device Mounting Technology Manual (C10535E)**.

**μPD16874GS**

Soldering Method	Soldering Conditions	Recommended Condition Symbol
Infrared reflow	Package peak temperature: 235°C, Time: 30 sec. Max. (at 210°C or higher), Count: two times, Exposure limit: Not limited <sup>Note</sup>	IR35-00-2
VPS	Package peak temperature: 215°C, Time: 40 sec. Max. (at 200°C or higher), Count: two times, Exposure limit: Not limited <sup>Note</sup>	VP15-00-2
Wave soldering	Solder bath temperature: 260°C Max., Time: 10 sec. Max., Count: once, Exposure limit: not limited <sup>Note</sup>	WS60-00-1
Partial heating	Pin temperature: 300°C Max., Time: 3 sec. Max., Exposure limit: not limited <sup>Note</sup>	—

**Note** After opening the dry pack, store it at 25°C or less and 65% RH or less for the allowable storage period.

**Cautions** Do not use different soldering methods together (except for partial heating).

**NOTES FOR CMOS DEVICES****① PRECAUTION AGAINST ESD FOR SEMICONDUCTORS**

Note:

Strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it once, when it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor devices on it.

**② HANDLING OF UNUSED INPUT PINS FOR CMOS**

Note:

No connection for CMOS device inputs can be cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to  $V_{DD}$  or GND with a resistor, if it is considered to have a possibility of being an output pin. All handling related to the unused pins must be judged device by device and related specifications governing the devices.

**③ STATUS BEFORE INITIALIZATION OF MOS DEVICES**

Note:

Power-on does not necessarily define initial status of MOS device. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the devices with reset function have not yet been initialized. Hence, power-on does not guarantee out-pin levels, I/O settings or contents of registers. Device is not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for devices having reset function.

## Regional Information

Some information contained in this document may vary from country to country. Before using any NEC product in your application, please contact the NEC office in your country to obtain a list of authorized representatives and distributors. They will verify:

- Device availability
- Ordering information
- Product release schedule
- Availability of related technical literature
- Development environment specifications (for example, specifications for third-party tools and components, host computers, power plugs, AC supply voltages, and so forth)
- Network requirements

In addition, trademarks, registered trademarks, export restrictions, and other legal issues may also vary from country to country.

- **The information in this document is current as of December, 2000. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC's data sheets or data books, etc., for the most up-to-date specifications of NEC semiconductor products. Not all products and/or types are available in every country. Please check with an NEC sales representative for availability and additional information.**
  - No part of this document may be copied or reproduced in any form or by any means without prior written consent of NEC. NEC assumes no responsibility for any errors that may appear in this document.
  - NEC does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC semiconductor products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC or others.
  - Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of customer's equipment shall be done under the full responsibility of customer. NEC assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.
  - While NEC endeavours to enhance the quality, reliability and safety of NEC semiconductor products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risks of damage to property or injury (including death) to persons arising from defects in NEC semiconductor products, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment, and anti-failure features.
  - NEC semiconductor products are classified into the following three quality grades:  
"Standard", "Special" and "Specific". The "Specific" quality grade applies only to semiconductor products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of a semiconductor product depend on its quality grade, as indicated below. Customers must check the quality grade of each semiconductor product before using it in a particular application.
    - "Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots
    - "Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)
    - "Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.
- The quality grade of NEC semiconductor products is "Standard" unless otherwise expressly specified in NEC's data sheets or data books, etc. If customers wish to use NEC semiconductor products in applications not intended by NEC, they must contact an NEC sales representative in advance to determine NEC's willingness to support a given application.
- (Note)
- (1) "NEC" as used in this statement means NEC Corporation and also includes its majority-owned subsidiaries.
  - (2) "NEC semiconductor products" means any semiconductor product developed or manufactured by or for NEC (as defined above).
