★ 3.5 PRECAUTIONS CONCERNING P00/INT4 PIN AND  $\overline{\text{RESET}}$  PIN

In addition to the functions shown in 3.1 and 3.2, the P00/INT4 pin and  $\overline{\text{RESET}}$  pin are also used to set the test mode for testing internal μPD75308B operation (for IC testing).

The test mode is set when a voltage greater than  $V_{DD}$  is applied to either of these pins. Consequently, if noise exceeding  $V_{DD}$  is applied during normal operation, the test mode may be entered, making it impossible for normal operation to continue.

For example, misoperation may result if inter-wiring noise is applied to the P00/INT4 or  $\overline{\text{RESET}}$  pin due to the length of the wiring from these pins, and the pin voltage exceeds  $V_{DD}$ .

Wiring should therefore be carried out so that inter-wiring noise is suppressed as far as possible. If it is completely impossible to suppress noise, noise prevention measures should be taken using an external component as shown below.

○ Diode connected between P00/INT4 or  $\overline{\text{RESET}}$  and  $V_{DD}$

○ Capacitor connected between P00/INT4 or  $\overline{\text{RESET}}$  and  $V_{DD}$

## 5. PERIPHERAL HARDWARE FUNCTIONS

### 5.1 PORTS

There are four kinds of I/O ports, as follows.

- CMOS input (PORT0, 1) : 8
  - CMOS input/output (PORT2, 3, 6, 7) : 16
  - N-ch open drain (PORT4, 5) : 8
  - CMOS output (BP0 to BP7) : 8
- 
- Total 40

**Fig. 5-1 Port Functions**

Port (Symbol)	Function	Operation/Features	Remarks
PORT 0	4-bit input	Always readable or testable irrespective of dual-function pin operating mode.	Dual function as INT4, SCK, SO/SB0 & SI/SB1 pins
PORT 1			Dual function as pins INT0 to INT2 & T10
PORT 2	4-bit input/output	Can be set to input or output mode as 4-bit unit. Ports 6 & 7 can be paired for 8-bit data input/output.	Dual function as PTO0, PCL & BUZ pins
PORT 7			Dual function as pins KR4 to KR7
PORT 3 *		Can be set to input or output mode bit-wise.	Dual function as LCDCL & SYNC pins
PORT 6			Dual function as pins KR0 to KR3
PORT 4 * PORT 5 *	4-bit input/output (N-ch open-drain 10 V withstand voltage)	Can be set to input or output mode as 4-bit unit. Ports 4 & 5 can be paired for 8-bit data input/output.	Incorporation of pull-up resistor can be specified bit-wise by mask option.
BP0 to BP7	1-bit output	Outputs data bit-wise. Switchable by software with LCD drive segment outputs S24 to S31.	Small drive capability. For CMOS load drive.

\* Direct LED drive capability

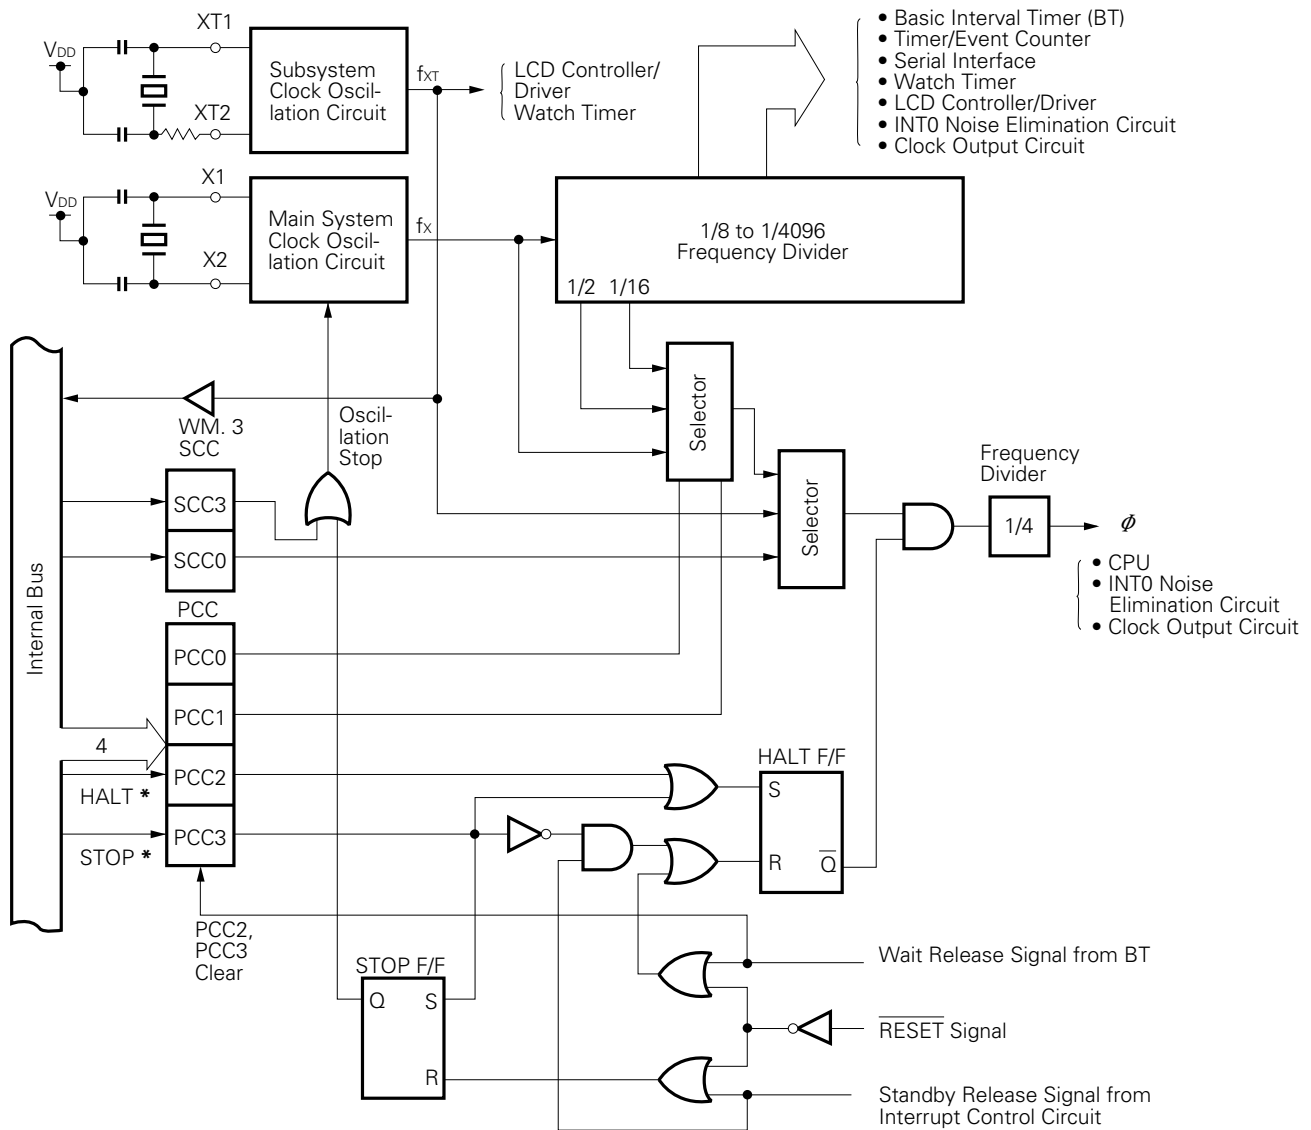

**5.2 CLOCK GENERATOR**

The operation of the clock generator is determined by the processor clock control register (PCC) and system clock control register (SCC).

There are two kinds of clock, the main system clock and subsystem clock, and the instruction execution time can be changed.

- 0.95 μs/1.91 μs/15.3 μs (4.19 MHz main system clock operation)
- 122 μs (32.768 kHz subsystem clock operation)

**Fig. 5-1 Clock Generator Block Diagram**

- Remarks**
1.  $f_X$  = Main system clock frequency
  2.  $f_{XT}$  = Subsystem clock frequency
  3. PCC: Processor clock control register
  4. SCC: System clock control register
  5. \* indicates instruction execution.

★

6. One  $\phi$  clock cycle ( $t_{CY}$ ) is one machine cycle. See "AC CHARACTERISTICS" in 11. "ELECTRICAL SPECIFICATIONS" for details of  $t_{CY}$ .

### 5.3 CLOCK OUTPUT CIRCUIT

The clock output circuit is a circuit which outputs a clock pulse from P22/PCL pin and is used to supply clock pulses to remote control outputs or peripheral LSI's.

- Clock output (PCL) :  $\Phi$  524, 262, 65.5 kHz (at 4.19 MHz operation)
- Buzzer output (BUZ): 2 kHz (at 4.19 MHz or 32.768 kHz operation)

The configuration of the clock output circuit is shown below.

Fig. 5-2 Clock Output Circuit Configuration

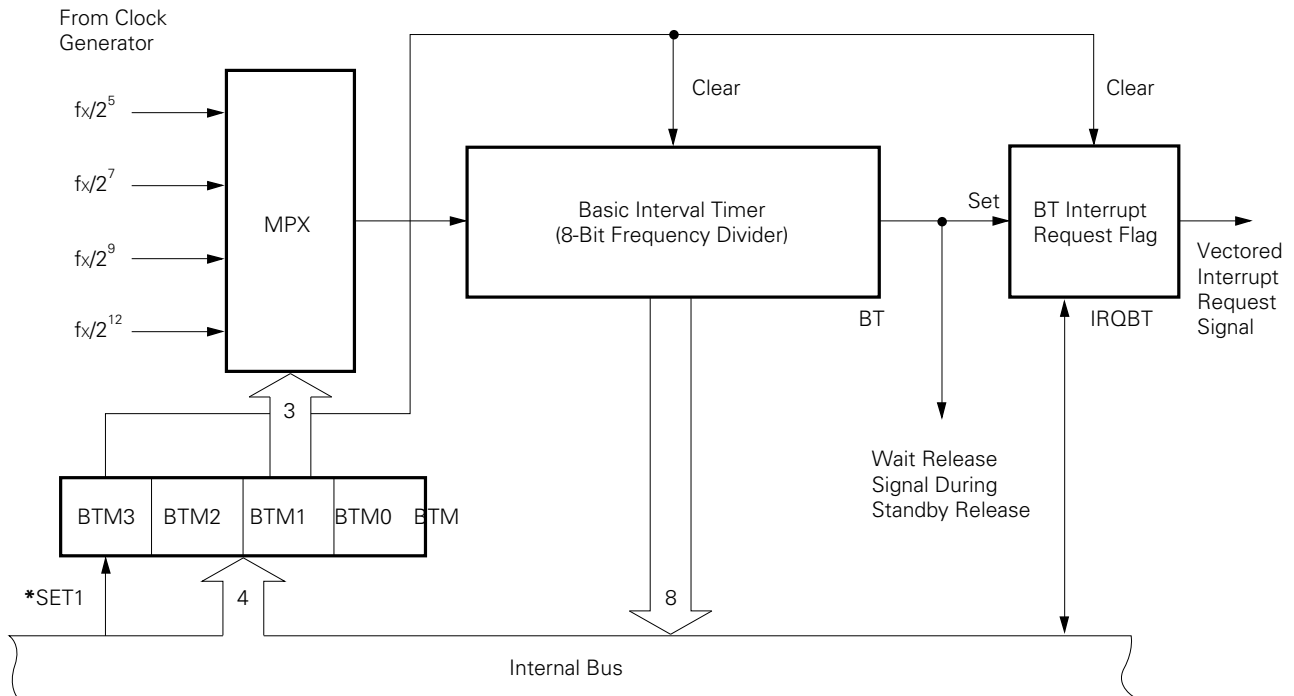

**Remarks** Consideration is given so that a low amplitude pulse is not output when switching between clock output enable and disable.

5.4 BASIC INTERVAL TIMER

The basic interval timer includes the following functions.

- It operates as an interval timer which generates reference time interrupts.
- It can be applied as a watchdog timer which detects when a program is out of control.
- Selects and counts wait times when the standby mode is released.
- It reads count contents.

Fig. 5-3 Basic Interval Timer Configuration

Remarks \* indicates instruction execution.

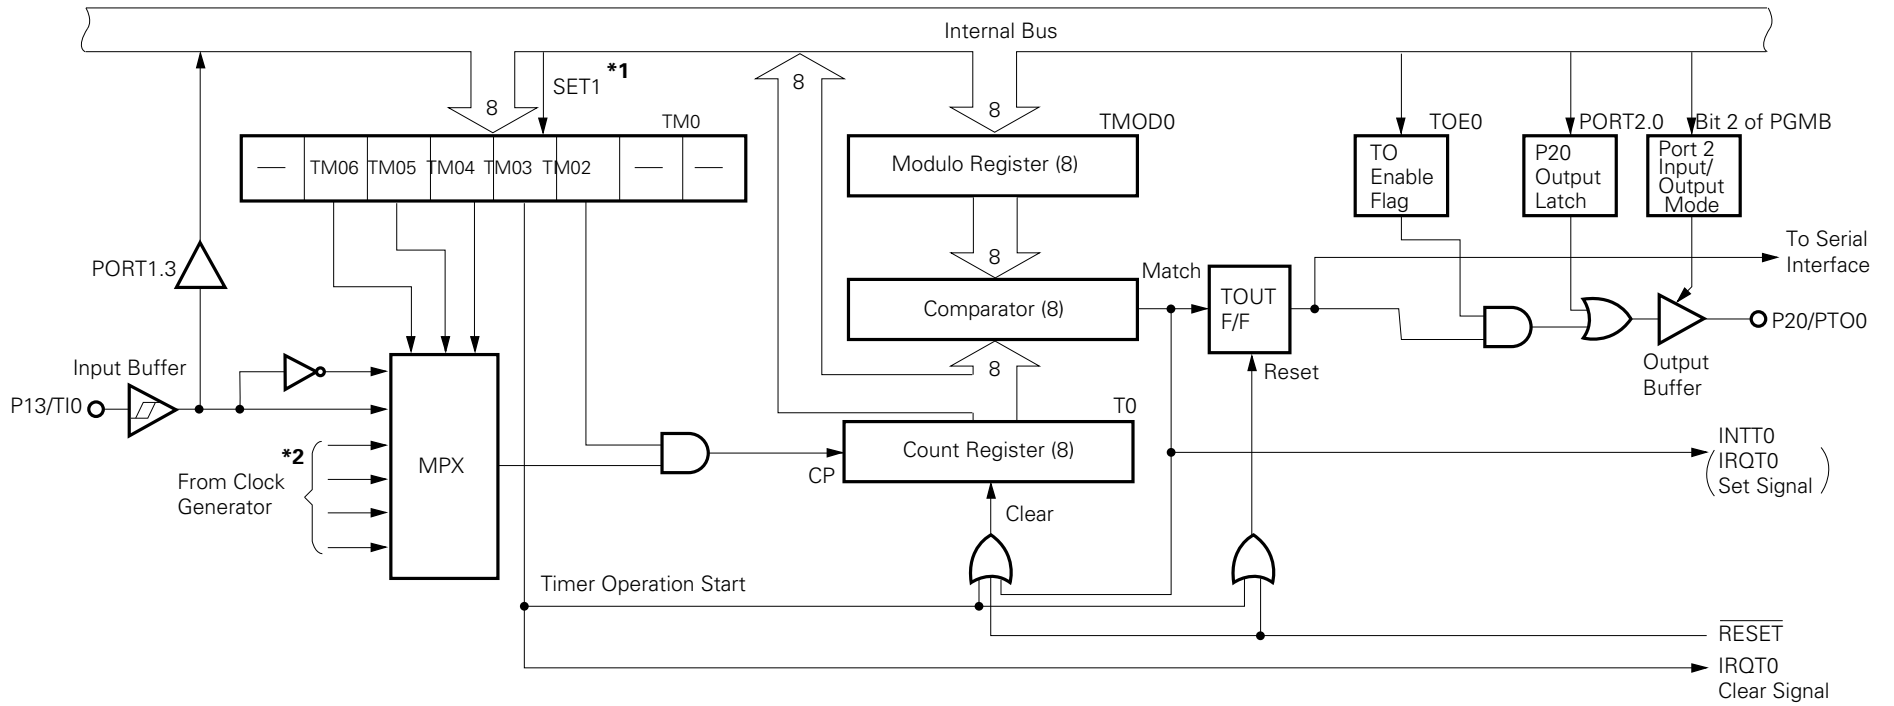

## 5.6 TIMER/EVENT COUNTER

The  $\mu$ PD75308B incorporates a single timer/event counter channel. The timer/event counter has the following functions.

- Operates as a programmable interval timer.
- Outputs square waves in the desired frequency to the PTO0 pin.
- Operates as an event counter.
- Divides the T10 pin input into N divisions and outputs it to the PTO0 pin (frequency divider operation).
- Supplies a serial shift clock to the serial interface circuit.
- Count status read function.

Fig. 5-5 Timer/Event Counter Block Diagram

- \* 1 SET1: Instruction execution
- 2 For detail, see Fig. 5-1.

## 5.7 SERIAL INTERFACE

The  $\mu$ PD75308B incorporates a clocked 8-bit serial interface. The serial interface has the following three modes.

- 3-wire serial I/O mode
- 2-wire serial I/O mode
- SBI mode (serial bus interface mode)

Fig. 5-6 Serial Interface Block Diagram

## 5.8 LCD CONTROLLER/DRIVER

The  $\mu$ PD75308B has an on-chip display controller which generates segment signals and common signals in accordance with data in display data memory as well as a segment driver and common driver capable of directly driving the LCD panel.

The configuration of the LCD controller/driver is shown in Fig. 5-7

The functions of the on-chip LCD controller/driver of the  $\mu$ PD75308B are as follows.

- Display data memory are read automatically through DMA operations and segment signals and common signals are generated.
- 5 different display modes can be selected.
  - ① Static
  - ② 1/2 duty (1/2 bias)
  - ③ 1/3 duty (1/2 bias)
  - ④ 1/3 duty (1/3 bias)
  - ⑤ 1/4 duty (1/3 bias)
- In each of the display modes, 4 types of frame frequency can be selected.
- The segment signal output is a maximum of 32 segments (S0 to S31) and 4 common outputs (COM0 to COM3).
- Segment signal outputs (S24 to S27, S28 to S31) are in 4-segment units and they can be switched for use as output ports (BP0 to BP3, BP4 to BP7).
- Split resistors can be built-in for the LCD driver power supply (mask option).
  - Conformity to various bias methods and LCD driver voltages is possible.
  - When the display is OFF, the current flowing to the split resistors is cut.
- Display data memory not used for the display can be used as ordinary data memory.
- Operation by the subsystem clock is also possible.

Fig. 5-7 LCD Controller/Driver Block Diagram

**5.9 BIT SEQUENTIAL BUFFER ..... 16 BITS**

The bit sequential buffer is special data memory for bit manipulations and can be used easily particularly for bit manipulations where addresses and bit specifications are changed sequentially, so it is convenient for processing data with long bit lengths bit-wise.

**Fig. 5-8 Bit Sequential Buffer Format**

**Remarks** In pmem.@L addressing, the specified bit corresponding to the L register is moved.

**6. INTERRUPT FUNCTION**

The μPD75218 has 8 interrupt sources, and prioritized multiple interrupts are possible.

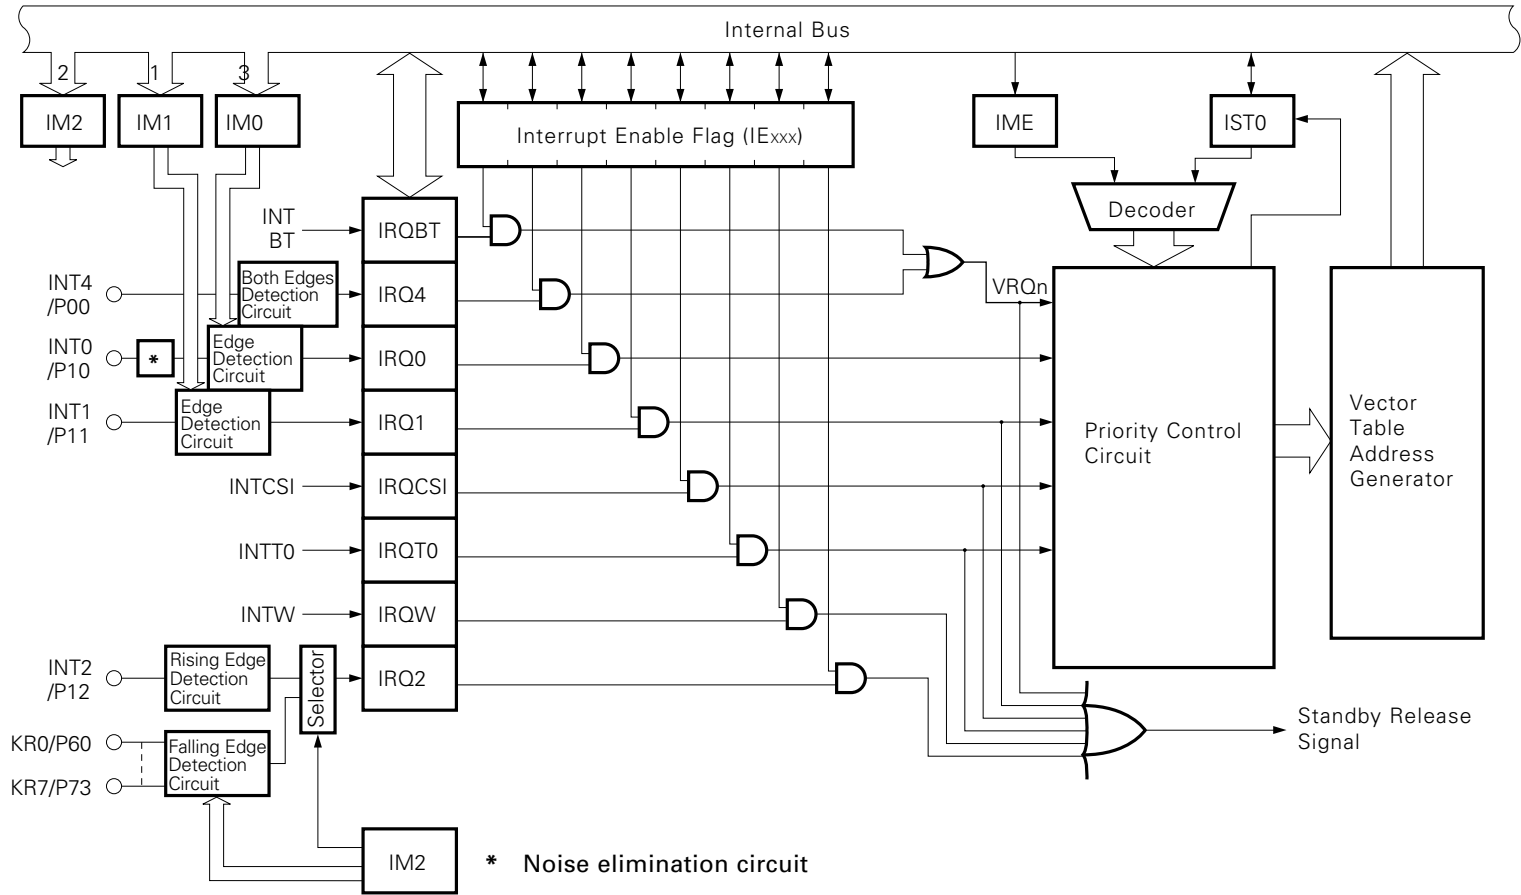

There are also two test sources, of which INT2 is an edge-detected testable input.

The μPD75218 interrupt control circuit has the following functions

- Hardware control vectored interrupt function that can control interrupt acceptance by interrupt flag (IE<sub>xxx</sub>) and interrupt master enable flag (IME).
- Arbitrary setting of interrupt start address.
- Multiple interrupt function with priority specifiable by the interrupt priority selection register (IPS).
- Interrupt request flag (IRQ<sub>xxx</sub>) test function (interrupt generation confirmation by software possible).
- Standby mode release (selection of interrupt that releases the standby mode by interrupt enable flag possible).

7. STANDBY FUNCTION

To reduce the power consumption during program wait, the μPD75308B has two standby modes: STOP mode and HALT mode.

Table 7-1 Operation Status at Standby Mode

		STOP Mode	HALT Mode
Setting instruction		STOP instruction	HALT instruction
System clock at setting		Only main system clock settable	Main system clock or subsystem clock settable
Operation Status	Clock oscillator	Only main system clock oscillation stopped	Only CPU clock $\phi$ stopped (oscillation continued)
	Basic interval timer	Stopped	Operating (IRQBT set at reference time intervals)*
	Serial interface	Operable only when external $\overline{SCK}$ input selected as serial clock	Operable*
	Timer/event counter	Operable only when TI0 pin input specified as count clock	Operable*
	Watch timer	Operable only when fXT selected as count clock	Operable
	LCD controller	Operable only when fXT selected as LCDCL	Operable
	External interrupt	INT1, 2, 4: Operable Only INT0 inoperable	
	CPU	Stopped	
Release signal		Interrupt request signal from operable hardware enabled by interrupt enable flag, or $\overline{RESET}$ input	Interrupt request signal from operable hardware enabled by interrupt enable flag, or $\overline{RESET}$ input

\* In-operable only with main system clock oscillation stopped.

8. RESET FUNCTION

The μPD75308B is reset and the hardware is initialized as shown in Table 8-1 by  $\overline{\text{RESET}}$  input. The reset operation timing is shown in Fig. 8-1.

Fig. 8-1 Reset Operation by  $\overline{\text{RESET}}$  Input

## 9. INSTRUCTION SET

### (1) Operand identifier and description

The operand is described in the operand field of each instruction in accordance with the description for the operand identifier of the instruction. (See the **RA75X Assembler Package User's Manual Language Volume (EEU-730)** for details.) When there are multiple elements in the description, one of the elements is selected. Upper case letters and symbols (+,-) are keywords and are described unchanged.

For immediate data, a suitable value or label is described.

Various register or flag symbols can be used as a label instead of mem, fmem, pmem, bit, etc. (See the **μPD75308 User's Manual (IEM-5016)** for details). However, there are restrictions on the labels for which fmem and pmem can be used (see the table on the previous page).

Identifier	Description	
reg	X, A, B, C, D, E, H, L	
regl	X, B, C, D, E, H, L	
rp	XA, BC, DE, HL	
rpl	BC, DE, HL	
rp2	BC, DE	
rpa	HL, DE, DL	
rpal	DE, DL	
n4	4-bit immediate data or label	
n8	8-bit immediate data or label	
mem*	8-bit immediate data or label	
bit	2-bit immediate data or label	
fmem	FB0H to FBFH, FF0H to FFFH immediate data or label	
pmem	FC0H to FFFH immediate data or label	
addr	μPD75304B	0000H to 0FFFH immediate data or label
	μPD75306B	0000H to 177FH immediate data or label
	μPD75308B	0000H to 1F7FH immediate data or label
caddr	12-bit immediate data or label	
faddr	11-bit immediate data or label	
taddr	20H to 7FH immediate data (however, bit0 = 0) or label	
PORTn	PORT 0 to PORT 7	
IExxx	IEBT, IECSI, IET0, IE0, IE1, IE2, IE4, IEW	
MBn	MB0, MB1, MB15	

\* Only an even address can be written for mem in the case of 8-bit data processing.

- Remarks**
1. MB indicates the accessible memory bank.
  2. For \*2, MB = 0 without regard to MBE and MBS.
  3. For \*4 and \*5, MB = 15 without regard to MBE and MBS.
  4. \*6 to \*10 indicate the addressable area.

**(4) Explanation of machine cycle field**

S shows the number of machine cycles required when skip is performed by an instruction with skip. The value of S changes as follows:

- No skip ..... S = 0
- When instruction to be skipped is 1-byte or 2-byte instruction ..... S = 1
- When instruction to be skipped is 3-byte instruction (BR !addr, CALL !addr instruction) ..... S = 2

**Note** One machine cycle is required to skip a GETI instruction.

One machine cycle is equivalent to one cycle (=tcy) of the CPU clock  $\phi$ . Three times can be selected by PCC setting.

**10. MASK OPTION SELECTION**

The following pin mask options are available.

Pin Functions	Mask Options
P40 to P43,	● Pull-up resistor incorporated (specifiable bit-wise)
P50 to P53	● No pull-up resistor (specifiable bit-wise)
$V_{LC0}$ to $V_{LC2}$ ,	● LCD drive power supply split resistor incorporated (specifiable as 4-bit unit)
BIAS	● No LCD drive power supply split resistor (specifiable as 4-bit unit)

MAIN SYSTEM CLOCK OSCILLATOR CHARACTERISTICS (Ta = -40 to +85 °C, VDD = 2.0 to 6.0 V)

RESONATOR	RECOMMENDED CONSTANT	PARAMETER	TEST CONDITIONS	MIN.	TYP.	MAX.	UNIT
Ceramic resonator*3		Oscillator frequency (fx)*1		1.0		5.0*3	MHz
		Oscillation stabilization time*2	After VDD reached the MIN. of the oscillation voltage range			4	ms
Crystal resonator*3		Oscillator frequency (fx)*1		1.0	4.19	5.0*3	MHz
		Oscillation stabilization time*2	VDD = 4.5 to 6.0 V			10	ms
External clock		X1 input frequency (fx)*1		1.0		5.0*3	MHz
		X1 input high-/low-level width (txH, txL)		100		500	ns

- \* 1. The oscillator frequency and X1 input frequency indicate only the oscillator characteristics. For the instruction execution time refer to the AC characteristics.
- 2. The oscillation stabilization time is necessary for oscillation to stabilize after applying VDD or releasing the STOP mode.
- 3. When the oscillation frequency is 4.19 MHz < fx ≤ 5.0 MHz, PCC = 0011 should not be selected as the instruction execution time. If PCC = 0011 is selected, one machine cycle is less than 0.95 s, and the specification MIN. value of 0.95 μs will not be achieved. ★

SUBSYSTEM CLOCK OSCILLATOR CHARACTERISTICS (Ta = -40 to +85 °C, VDD = 2.0 to 6.0 V)

RESONATOR	RECOMMENDED CONSTANT	PARAMETER	TEST CONDITIONS	MIN.	TYP.	MAX.	UNIT
Crystal resonator		Oscillator frequency (f <sub>XT</sub> )		32	32.768	35	kHz
		Oscillation stabilization time*	V <sub>DD</sub> = 4.5 to 6.0 V		1.0	2	s
						10	s
External clock		XT1 input frequency (f <sub>XT</sub> )		32		100	kHz
		XT1 input high-/low-level width (t <sub>XTH</sub> , t <sub>XTL</sub> )		5		15	μs

\* This is the time required for oscillation to stabilize after V<sub>DD</sub> reaches the MIN. value of the oscillation voltage range.

★ **Note** When the main system clock and subsystem clock oscillators are used, the following should be noted concerning wiring in the area in the figure enclosed by a dotted line to prevent the influence of wiring capacitance, etc.

- The wiring should be kept as short as possible.
- No other signal lines should be crossed. Keep away from lines carrying a high fluctuating current.
- The oscillator capacitor grounding point should be at the same potential as V<sub>DD</sub>. Do not ground to a ground pattern carrying a high current.
- A signal should not be taken from the oscillator.

The subsystem clock oscillator is a low-amplitude circuit in order to achieve a low consumption current, and is more prone to misoperation due to noise than the main system clock oscillator. Particular care is therefore required with the wiring method when the subsystem clock is used.

- \* 1. The CPU clock ( $\phi$ ) cycle time (minimum instruction execution time) is determined by the oscillator frequency of the connected resonator, the system clock control register (SCC) and the processor clock control register (PCC). The figure at the right indicates the cycle time  $t_{cy}$  versus supply voltage  $V_{DD}$  characteristic with the main system clock operating.
- 2.  $2t_{cy}$  or  $128/f_x$  is set by setting the interrupt mode register (IM0).

13. RECOMMENDED SOLDERING CONDITIONS

These products should be soldered and mounted under the conditions recommended below.

For details of recommended soldering conditions, refer to the information document "Surface Mount Technology Manual (IEI 1207)".

For soldering methods and conditions other than those recommended, please contact our salesman.

Table 13-1 Surface Mount Type Soldering Conditions

- (1) μPD75304BGC-xxx-3B9: 80-Pin Plastic QFP (□14 mm)
- μPD75306BGC-xxx-3B9: 80-Pin Plastic QFP (□14 mm)

**APPENDIX B. DEVELOPMENT TOOLS**

The following development tools are available for system development using the μPD75304B/75306B/75308B.

Hardware	IE-75000-R*1 IE-75001-R	75X series in-circuit emulator
	IE-75000-R-EM*2	Emulation board for the IE-75000-R or IE-75001-R
	EP-75308GF-R EV-9200G-80	Emulation probe for the μPD75304BGF, 75306BGF and 75308BGF. An 80-pin conversion socket (EV-9200G-80) is also provided.
	EP-75308BGC-R EV-9200GC-80	Emulation probe for the μPD75304BGC, 75306BGC and 75308BGC. An 80-pin conversion socket (EV-9200GC-80) is also provided.
	EP-75308BGK-R EV-9500GK-80	Emulation probe for the μPD75304BGK, 75306BGK and 75308BGK. An 80-pin conversion adapter (EV-9200GK-80) is also provided.
	PG-1500	PROM programmer
	PA-75P308GF	PROM programmer adapter for the μPD75P316AGF, connected to the PG-1500.
	PA-75P316BGC	PROM programmer adapter for the μPD75P316BGC, connected to the PG-1500.
	PA-75P316BGK	PROM programmer adapter for the μPD75P316BGK, connected to the PG-1500.
	Software	IE Control Program
PG-1500 Controller		PC-9800 series (MS-DOS™ Ver. 3.30 to Ver. 5.00A*3)
RA75X Relocatable Assembler		IBM PC/AT™(PC DOS™ Ver. 3.1)

- \* 1. Maintenance product
- 2. Not incorporated in the IE-75001-R.
- 3. A task swapping function is provided in Ver. 5.00/5.00A, but this function cannot be used with this software.

**Remarks** Please refer to the 75X Series Selection Guide (IF-151) for third party development tools.
