

16/8 BIT SINGLE-CHIP MICROCOMPUTER

The μ PD78P368A is produced by replacing the internal mask ROM of the μ PD78366A with a one-time PROM or EPROM. One-time PROM products, in which data can be written once are effective for manufacture of small quantities of multiple products and early stage start-up of application. EPROM products, to which programs can be re-written after previously written programs have been erased, are suited for system evaluation.

The following user's manual describes the details of functions. Be sure to read it before design.

μ PD78366A User's Manual, Hardware: U10205E

μ PD78356 User's Manual, Instructions: IEU-1395

FEATURES

- Compatible with the μ PD78366A
 - Can be replaced with the μ PD78366A containing mask ROM on a full-production basis.
- Internal PROM: 48K bytes
 - Data can be written once (one-time PROM product without an erasure window)
 - Written data can be erased by exposure to ultraviolet light and re-written electrically (EPROM product with an erasure window)
- PROM programming characteristics: Compatible with the μ PD27C1001A
- QTOPTTM microcomputer

Remark The QTOP microcomputer is a single-chip microcomputer with a built-in one-time PROM that is totally supported by NEC. The support includes writing application programs, marking, screening, and verification.

2. MEMORY CONFIGURATION

The μPD78P368A can access memory of up to 64K bytes. Fig. 2-1 shows the memory map.

Fig. 2-1 Memory Map

Note Access in the external memory expansion mode.

Caution When word access (including the stack operation) to the main RAM space (FE00H to FEFFH) is executed, the addresses specified in the operand must be even numbers.

3. DIFFERENCES BETWEEN THE μPD78P368A AND μPD78366A

The μPD78P368A is produced by replacing the internal mask ROM of the μPD78366A with a 48K-byte PROM. Both have the same functions except some differences in ROM specifications, such as write and verify modes. Table 3-1 shows the differences.

In this manual, the functions specific to the μPD78P368A are explained. For details of the other functions, refer to the μPD78366A document.

Table 3-1 Differences between the μPD78P368A and μPD78366A

Item	μPD78P368A		μPD78366A
ROM	48K bytes		32K bytes
Internal program memory (Electrical write)	One-time PROM (Data can be written once)	EPROM (Data can be written multiple times)	Mask ROM
PROM programming pin	Provided		Not provided
Setting of MODE0 and MODE1	<ul style="list-style-type: none"> • Normal operation mode MODE0, 1 = LL • PROM programming mode MODE0, 1 = HL 		<ul style="list-style-type: none"> • Normal operation mode MODE0, 1 = LL • ROM-less mode MODE0, 1 = HH
Package	80-pin plastic QFP	80-pin ceramic WQFN	80-pin plastic QFP
Electrical characteristics	They differ in supply current and other factors.		
Others	Since each product has a different circuit scale and mask layout, the noise immunity and noise radiation of each product differ.		

- Cautions 1. The PROM and mask ROM products differ in noise immunity and noise radiation. Use not ES products but CS products (mask ROM products) to evaluate them thoroughly when considering the change from the PROM products to the mask ROM products during processes from preproduction to volume production.**
- 2. Connect the MODE0 and MODE1 pins directly to the V_{DD} or V_{SS} pin.**

4. PROM PROGRAMMING

The μPD78P368A is provided with an electrically writable PROM of 48K × 8 bits. When programming this PROM, use the MODE0/V_{PP} and MODE1 pins to set the μPD78P368A to the PROM programming mode.

The μPD78P368A provides programming characteristics compatibility with the μPD27C1001A.

Table 4-1 Pin Functions in Programming Mode

Function	Normal operation mode	Programming mode
Address input	P00-P07, P21, P20, P80-P85, P30	A0-A16
Data input	P40-P47	D0-D7

4.1 OPERATION MODE

To enter the program write/verify mode, set each pin as follows: MODE0/V_{PP} = H, MODE1 = L. In addition, any of the operation modes listed in Table 4-2 can be selected by setting the \overline{CE} , \overline{OE} , and PGM pins in this mode.

Set the μPD78P368A to the read mode in order to read the contents of PROM.

Handle unused pins as described in PIN CONFIGURATION (2).

Output disable		L	H	×			High impedance
Standby		H	×	×			High impedance

Remark ×: L or H

4.2 PROCEDURE FOR WRITING ON PROM (PAGE PROGRAM MODE)

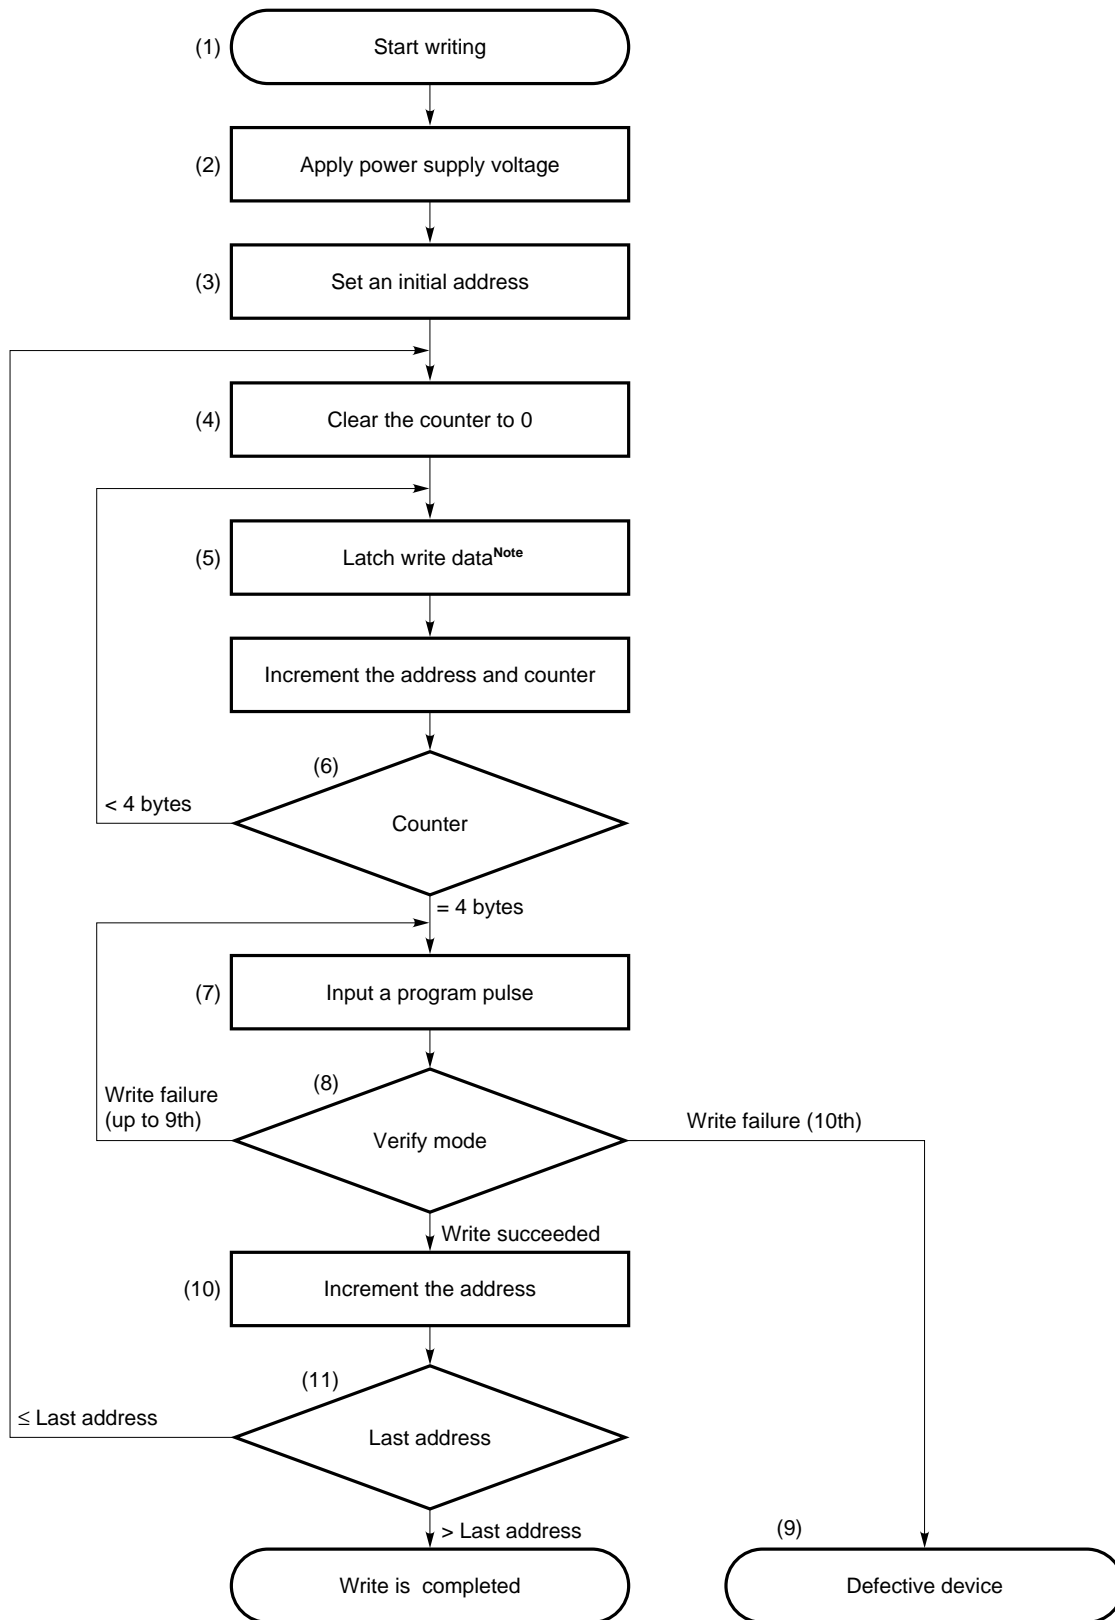

The following is a procedure for writing on PROM. (See Fig. 4-1.)

In the page program mode, data is written in units of pages (four bytes). When write data completes midway of a page, latch FFH after the data so that the data fits into pages.

- (1) Always set each pin as follows: MODE0/V_{PP} = H and MODE1 = L. Connect unused pins according to PIN CONFIGURATION (2).
- (2) Apply +6.5 V to the V_{DD} pin and +12.5 V to the V_{PP} pin.
- (3) Input an initial address to the A0 to A16 pins.
- (4) Clear the page counter.
- (5) Data latch mode. Input write data to the D0 to D7 pins and input an active-low pulse to the $\overline{\text{OE}}$ pin. Increment the address and the page counter.
- (6) Repeat step (5) for a page (four bytes).
- (7) Input a 0.1 ms program pulse (active low) to the $\overline{\text{PGM}}$ pin.
- (8) Verify mode. Checks if data has been written in PROM.
Apply a low level to the $\overline{\text{CE}}$ pin, input an active-low pulse to the $\overline{\text{OE}}$ pin, and then read the write data from the D0 to D7 pins. Repeat this for a page (four bytes). When verification completes, apply a high level to the $\overline{\text{CE}}$ pin.
 - If data has been written, go to step (10).
 - If not, repeat steps (7) and (8). If no data is written yet after the steps have been repeated 10 times, go to step (9).
- (9) Assume the device to be defective and stop write operation.
- (10) Increment the address.
- (11) Repeat steps (4) to (10) until the address exceeds the last address.

Fig. 4-2 is a timing chart of these steps (2) to (9).

Fig. 4-1 Flowchart of Procedure for Writing (Page Program Mode)

Note If write data does not fill a page, latch FFH for the rest of the page.

Fig. 4-2 PROM Write/Verify Timing Chart (Page Program Mode)

4.3 PROCEDURE FOR WRITING ON PROM (BYTE PROGRAM MODE)

The following is a procedure for writing on PROM. (See Fig. 4-3.)

- (1) Always set each pin as follows: MODE0/V_{PP} = H and MODE1 = L. Connect unused pins according to PIN CONFIGURATION (2).
- (2) Apply +6.5 V to the V_{DD} pin and +12.5 V to the MODE0/V_{PP} pin, and input a low-level signal to the \overline{CE} pin.
- (3) Input an initial address to the A0 to A16 pins.
- (4) Input write data to the D0 to D7 pins.
- (5) Input a 0.1 ms program pulse (active low) to the \overline{PGM} pin.
- (6) Verify mode. Checks if data has been written in PROM.
Input an active-low pulse to the \overline{OE} pin and read the write data from the D0 to D7 pins.
 - If data has been written, go to step (8).
 - If not, repeat steps (4) to (6). If no data is written yet after the steps have been repeated 10 times, go to step (7).
- (7) Assume the device to be defective and stop write operation.
- (8) Increment the address.
- (9) Repeat steps (4) to (8) until the address exceeds the last address.

Fig. 4-4 is a timing chart of these steps (2) to (7).

Fig. 4-3 Flowchart of Procedure for Writing (Byte Program Mode)

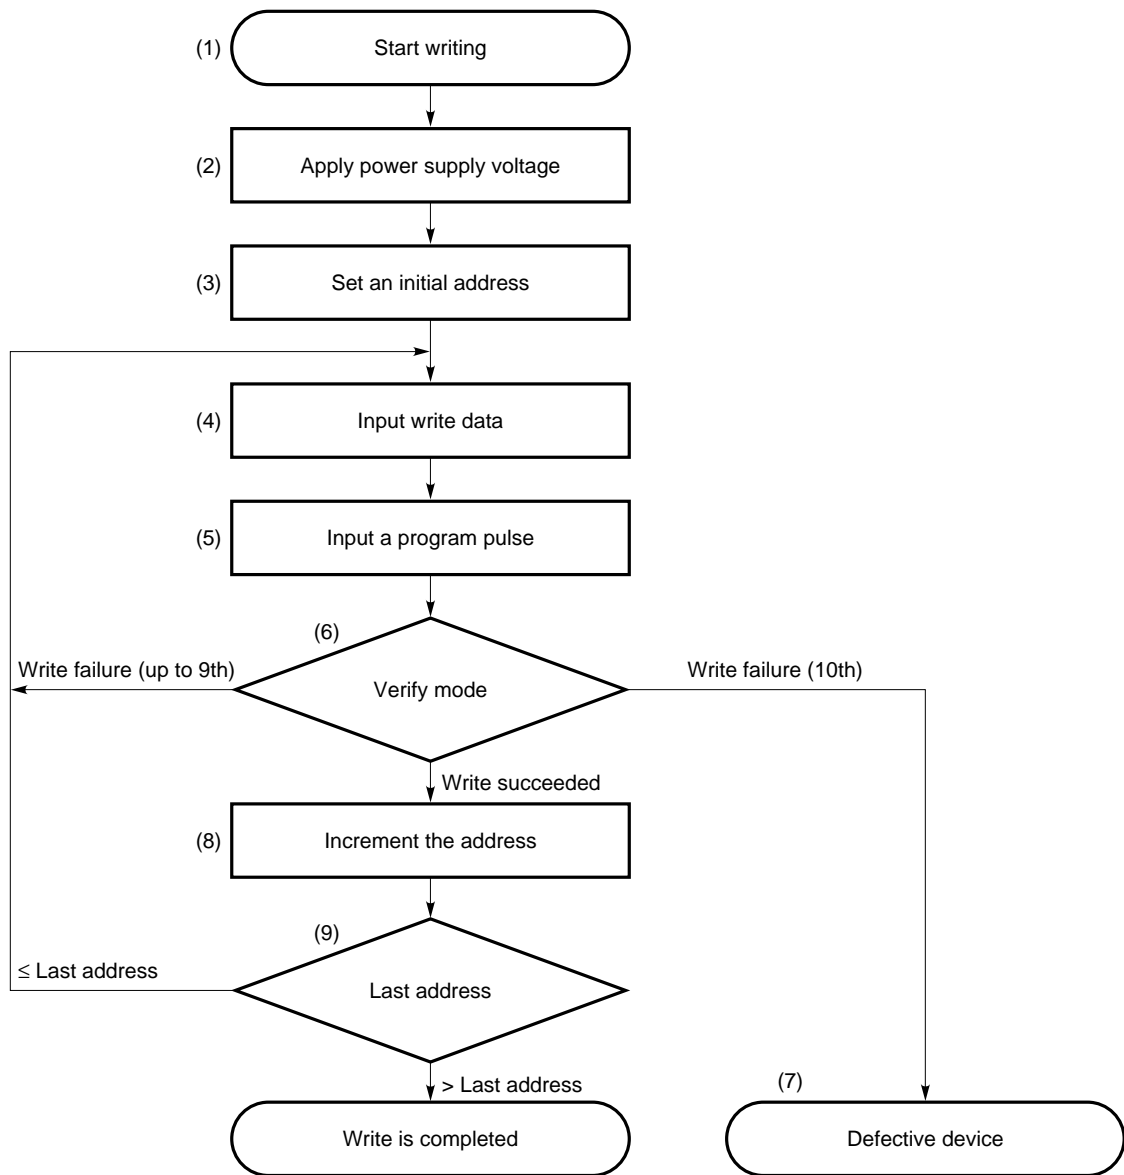

Fig. 4-4 PROM Write/Verify Timing Chart (Byte Program Mode)

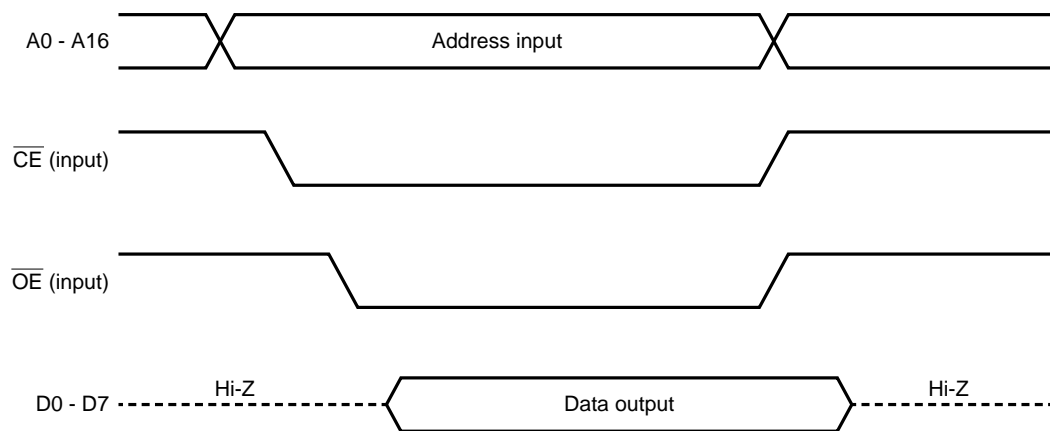

4.4 PROCEDURE FOR READING FROM PROM

The following is a procedure for reading out the contents of PROM to the external data bus (D0 to D7).

- (1) Always set each pin as follows: MODE0/V_{PP} = H and MODE1 = L. Connect unused pins according to PIN CONFIGURATION (2).
- (2) Apply +5 V to the V_{DD} and MODE0/V_{PP} pins.
- (3) Input the address of data to be read into the A0 to A16 pins.
- (4) Read mode ($\overline{CE} = L, \overline{OE} = L$)
- (5) Output the data on the D0 to D7 pins.

Fig. 4-5 is a timing chart of these steps (2) to (5).

Fig. 4-5 PROM Read Timing Chart

5. ERASURE CHARACTERISTICS (μ PD78P368AKL-S ONLY)

Data written in the μ PD78P368AKL-S program memory can be erased (FFH); therefore users can write other data in the memory.

To erase the written data, expose the erasure window to light with a wavelength shorter than approx. 400 nm. Normally, ultraviolet light with a wavelength of 254 nm is employed. The amount of light required to completely erase the data is as follows:

- Intensity of ultraviolet light \times erasing time: 15 W•s/cm² min.
- Erasing time: 15 to 20 minutes (When using a 12,000 μ W/cm² ultraviolet lamp. It may, however, take more time due to lamp deterioration, dirt on the erasure window, or the like.)

The ultraviolet lamp should be placed within 2.5 cm from the erasure window during erasure. In addition, if a filter is attached to the ultraviolet lamp, remove the filter before erasure.

6. PROTECTIVE FILM COVERING THE ERASURE WINDOW (μ PD78P368AKL-S ONLY)

After the erasure window of the μ PD78P368AKL-S has been exposed to sunlight or a fluorescent lamp for a long time, data in EPROM may be erased and the internal circuits may malfunction. To prevent these failures, the erasure window should be covered with a protective film when it is not used for erasure.

EPROM package products with a window are supplied with a NEC-guaranteed protective film when they are delivered.

7. SCREENING ONE-TIME PROM PRODUCTS

NEC cannot execute a complete test of one-time PROM products (μ PD78P368AGF-3B9) due to their structure before shipment. It is recommended that you screen (verify) PROM products after writing necessary data into them and storing them at 125 °C for 24 hours.

NEC offers a charged service called QTOP microcomputer service. This service includes writing to one-time PROM, marking, screening, and verification. Ask your sales representative for details.

8. ELECTRICAL SPECIFICATIONS

ABSOLUTE MAXIMUM RATINGS (T_A = 25 °C)

Parameter	Symbol	Conditions	Rating	Unit

Caution Absolute maximum ratings are rated values beyond which some physical damages may be caused to the product; if any of the parameters in the table above exceeds its rated value even for a moment, the quality of the product may deteriorate. Be sure to use the product within the rated values.

RECOMMENDED OPERATING CONDITIONS

Oscillation frequency	T _A	V _{DD}
3 MHz - f _{xx} - 8 MHz	-40 to +85 °C	+5.0 V ±10 %

CAPACITANCE (T_A = 25 °C, V_{SS} = V_{DD} = 0 V)

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Unit
Input capacitance	C _I	f = 1 MHz			20	pF
Output capacitance	C _O	0 V except measured pins			20	pF
I/O capacitance	C _{IO}				20	pF

OSCILLATOR CHARACTERISTICS (T_A = -40 to +85 °C, V_{DD} = +5 V ±10 %, V_{SS} = 0 V)

Resonator	Recommended circuit	Parameter	Min.	Max.	Unit
Ceramic resonator or crystal		Oscillation frequency (f _{xx})	3	8	MHz
External clock		X1 input frequency (f _x)	3	8	MHz
		X1 rise/fall time (t _{xR} , t _{xF})	0	30	ns
		X1 input high-/low-level width (t _{wXH} , t _{wXL})	40	170	ns

Caution When using system clock oscillation circuits, to reduce the effect of the wiring capacitance, etc, wire the area indicated by dotted-line as follows:

- Make the wiring as short as possible.
- Do not allow the wiring to intersect other signal lines. Keep it away from other lines in which varying high currents flow.
- Make sure that the ground point of the oscillation circuit capacitor is always at the same electric potential as V_{SS}. Do not allow the wiring to be grounded to a ground pattern in which very high currents are flowing.
- Do not extract signals from the oscillation circuit.

Notes 1. Pins other than those specified in **Note 2**.

2. RESET, X1, X2, P20/NMI, P21/INTP0, P22/INTP1, P23/INTP2, P24/INTP3/TI, P25/INTP4, P32/SO/SB0, P33/SI/SB1 and P34/SCK pins.
3. Pins other than those specified in **Notes 4 and 5**.
4. P80/TO00-P85/TO05 pins (When I_{OL} = 15 mA is in operation, up to three pins can be ON simultaneously.)
5. P00/RTP0-P03/RTP3, P04/PWM0, P05/TCUD/PWM1, P06/TIUD/TO40 and P07/TCLRUD pins (When I_{OL} = 10 mA is in operation, up to four pins can be ON simultaneously.) as well as P10-P17 pins (When I_{OL} = 10 mA is in operation, up to four pins can be ON simultaneously.).

Caution When the P80-P85, P00-P07, and P10-P17 pins are not used under the conditions specified in **Notes 4 and 5**, they have the same characteristics as in **Note 3**.

t _{dWOD}	0.5T - 10	Max.	ns
t _{sODW}	(1 + n) T - 5	Min.	ns

Remarks 1. T = t_{cyk} = 1/f_{CLK} (f_{CLK} refers to the internal system clock frequency.)

2. a becomes 1 when the address wait is inserted. Otherwise, it becomes 0.
3. n refers to the number of wait cycles that is inserted by specifying the PWC register.
4. Only the bus timings indicated in this table depend on t_{cyk}.

A/D converter data retention current	AI _{DDDR}	STOP mode	AV _{DDDR} = 2.5 V		2	10	μA
			AV _{DDDR} = 5 V ±10 %		10	50	μA

Notes 1. The quantization error is excluded.

2. When -0.3 V - V_{IAN} - 0 V, the conversion result becomes 000H.

When 0 V < V_{IAN} < AV_{REF}, the conversion is performed with the 10-bit resolution.

When AV_{REF} - V_{IAN} - AV_{REF} + 0.3 V, the conversion result becomes 3FFH.

3. The analog input impedance at the time of sampling is the same as the equivalent circuit shown below. (The values in the diagram are TYP. values; they are not guaranteed values.)

- Cautions 1.** When using the P70/ANI0-P77/ANI7 pins for both digital and analog inputs, the previously described characteristics are not guaranteed. Therefore, ensure that all of the eight P70/ANI0-P77/ANI7 pins are used either for analog input or digital input.
- 2.** When using the P70/ANI0-P77/ANI7 pins as digital input, make sure to set that $AV_{DD} = V_{DD}$, and $AV_{SS} = V_{SS}$.

PROM Write Mode Timing (Page Program Mode)

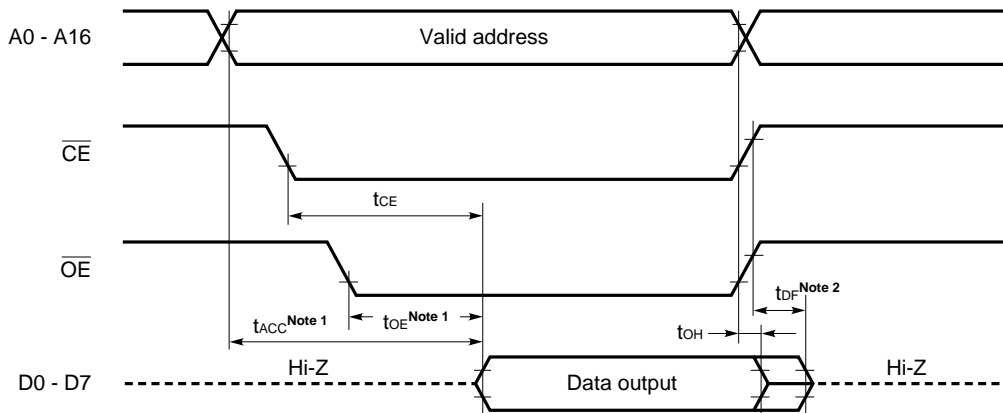

PROM Write Mode Timing (Byte Program Mode)

- Cautions**
1. V_{DDP} must be applied before V_{PP}, and must be cut after V_{PP}.
 2. V_{PP} including overshoot must not exceed +13.5 V.
 3. Plugging in or out the board with the V_{PP} pin supplied with +12.5 V may adversely affect its reliability.

PROM Read Mode Timing

- Notes**
1. For reading within t_{ACC}, the delay of the OE input from falling edge of CE must be within t_{ACC} - t_{oE}.
 2. t_{DF} is the time measured from when either OE or CE reaches V_{IH}, whichever is faster.

10. RECOMMENDED SOLDERING CONDITIONS

These products should be soldered and mounted under the conditions recommended below.

For details of recommended soldering conditions, refer to the information document *Semiconductor Device Mounting Technology Manual (C10535J)*.

For soldering methods and conditions other than those recommended, please contact your NEC sales representative.

Table 10-1. Surface Mount Type Soldering Conditions

μPD78P368AGF-3B9: 80-Pin Plastic QFP (14 × 20 mm)

Soldering method	Soldering conditions	Recommended condition symbol
Infrared reflow	Package peak temperature: 235 °C, Duration: 30 sec. max. (210 °C or above) Number of times: 2 max. Exposure limit: 7 days Note (20 hours of pre-baking is required at 125 °C afterward) <Caution> Non-heat-resistant trays, such as magazine and taping trays, cannot be baked before unpacking.	IR35-207-2
VPS	Package peak temperature: 215 °C, Duration: 40 sec. max. (200 °C or above) Number of times: 2 max. Exposure limit: 7 days Note (20 hours of pre-baking is required at 125 °C afterward) <Caution> Non-heat-resistant trays, such as magazine and taping trays, cannot be baked before unpacking. Partial heating	Pin temperature: 300 °C or less Duration: 3 sec. max. (per side of device)	—

Note Maximum number of days during which the product can be stored at a temperature of 25 °C and a relative humidity of 65 % or less after dry-pack package is opened.

Caution Use of more than one soldering method should be avoided (except in the case of partial heating).

APPENDIX A TOOLS

A.1 DEVELOPMENT TOOLS

The following tools are provided for developing a system that uses the μPD78P368A:

Language processor

78K/III series relocatable assembler (RA78K3)	This relocatable program can be used for all 78K/III series emulators. With its macro functions, it allows the user to improve program development efficiency. A structured-programming assembler is also provided, which enables explicit description of program control structures. This assembler could improve productivity in program production and maintenance.

Remark It is guaranteed that the PG-1500 controller runs only under the OSs on the corresponding host machines described above.

Debugging tools (when the IE controller is used)

Hardware	IE-78350-R	In-circuit emulator for developing and debugging an application system. For debugging, connect the emulator to the host machine.			
	IE-78365-R-EM1	I/O emulation board for emulating peripheral hardware such as the I/O ports of the target device.			
	EP-78365GF-R EV-9200G-80	Emulation probe for connecting the IE-78350-R to the target system. One EV-9200G-80 conversion socket is provided for connection to the target system.			
Software	IE-78350-R control program (IE controller)	This control program allows the user to control the IE-78350-R from the host machine. Its automatic command execution function ensures more efficient debugging.

Configuration of development tools (when the IE controller is used)

Note The socket is supplied with the emulation probe.

- Remarks**
1. The PG-1500 can be directly connected to the host machine via the RS-232-C interface.
 2. In this figure, the distribution media of software is represented by the 3.5-inch floppy disk.

Debugging tools (when the integrated debugger is used)

Hardware	IE-784000-R	In-circuit emulator for developing and debugging an application system. For debugging, connect the emulator to the host machine.				
	IE-78350-R-EM-A ^{Note}	Emulation board for emulating peripheral hardware such as the I/O ports of the target device.				
	IE-78365-R-EM1	I/O emulation board for emulating peripheral hardware such as the I/O ports of the target device.				
	EP-78365GF-R	Emulation probe for connecting the IE-784000-R to the target system. One EV-9200G-80 conversion socket is provided for connection to the target system.				
	EV-9200G-80					
	IE-70000-98-IF-B	Interface adapter when the PC-9800 series computer (other than a notebook) is used as the host machine.				
	IE-70000-98N-IF	Interface adapter and cable when a PC-9800 series notebook is used as the host machine.				
	IE-70000-PC-IF-B	Interface adapter when the IBM PC/AT is used as the host machine.				
IE-78000-R-SV3	Interface adapter and cable when the EWS is used as the host machine.					
Software	Integrated debugger (ID78K3)	Program for controlling the in-circuit emulator for the 78K/III series. The integrated debugger (ID78K3) is used together with the device file (DF78365). Debugging can be performed for the source program written in C, structured assembly language, or assembly language. The ID78K3 can display various information simultaneously on the host machine screen divided into multiple areas. This ensures efficient debugging.

A.2 EMBEDDED SOFTWARE

To improve the efficiency of program development and simplify the maintenance of systems incorporating this microcontroller, the following embedded software is provided.

Real-time OS

Real-time OS (RX78K/III) Note	This operating system was designed to provide a multitasking environment for control applications that require real-time processing. System performance is improved by using the idling CPU for other processing. RX78K/III provides system calls that conform to μITRON specifications. The RX78K/III package provides the RX78K/III nucleus and a tool (Configurator) that is used for creating multiple information tables.			
	Host machine	OS	Distribution media	Part number
	PC-9800 series	MS-DOS	3.5-inch 2HD	Undecided
			5.25-inch 2HD	Undecided
	IBM PC/AT or compatibles	PC DOS	3.5-inch 2HC	Undecided
5.25-inch 2HC			Undecided	

Note Under development

Caution Before purchasing this software, complete the purchase application sheet and sign the software license agreement.

Remark To use the RX78K/III real-time operating system, the optional RA78K3 assembler package is required.

Fuzzy inference development support system

Tool for creating fuzzy knowledge data (FE9000, FE9200)	This program supports the input/editing and simulation of fuzzy knowledge data (fuzzy rules and membership functions).			
	Host machine	OS	Distribution media	Part number
	PC-9800 series	MS-DOS	3.5-inch 2HD	μS5A13FE9000
			5.25-inch 2HD	μS5A10FE9000
	IBM PC/AT or compatibles	PC DOS + Windows	3.5-inch 2HC	μS7B13FE9200
5.25-inch 2HC			μS7B10FE9200	
Translator (FT78K3) ^{Note}	This program converts fuzzy knowledge data, obtained using the tool for creating fuzzy knowledge data, into an assembler source program for RA78K3.			
	Host machine	OS	Distribution media	Part number
	PC-9800 series	MS-DOS	3.5-inch 2HD	μS5A13FT78K3

	IBM PC/AT or compatibles	PC DOS	3.5-inch 2HC	μS7B13FT78K3
5.25-inch 2HC			μS7B10FT78K3	
Fuzzy inference module (FI78K/III) ^{Note}	This program performs fuzzy inference by linking the fuzzy knowledge data converted by Translator.			
	Host machine	OS	Distribution media	Part number
	PC-9800 series	MS-DOS	3.5-inch 2HD	μS5A13FI78K3
			5.25-inch 2HD	μS5A10FI78K3
	IBM PC/AT or compatibles	PC DOS	3.5-inch 2HC	μS7B13FI78K3
5.25-inch 2HC			μS7B10FI78K3	
Fuzzy inference debugger (FD78K/III)	This software supports the evaluation and adjustment of fuzzy knowledge data at the hardware level, by using an in-circuit emulator.

Cautions on CMOS Devices

Countermeasures against static electricity for all MOSs

Caution When handling MOS devices, take care so that they are not electrostatically charged.

Strong static electricity may cause dielectric breakdown in gates. When transporting or storing MOS devices, use conductive trays, magazine cases, shock absorbers, or metal cases that NEC uses for packaging and shipping. Be sure to ground MOS devices during assembling. Do not allow MOS devices to stand on plastic plates or do not touch pins.

Also handle boards on which MOS devices are mounted in the same way.

CMOS-specific handling of unused input pins

Caution Hold CMOS devices at a fixed input level.

Unlike bipolar or NMOS devices, if a CMOS device is operated with no input, an intermediate-level input may be caused by noise. This allows current to flow in the CMOS device, resulting in a malfunction. Use a pull-up or pull-down resistor to hold a fixed input level. Since unused pins may function as output pins at unexpected times, each unused pin should be separately connected to the V_{DD} or GND pin through a resistor.

If handling of unused pins is documented, follow the instructions in the document.

Statuses of all MOS devices at initialization

Caution The initial status of a MOS device is unpredictable when power is turned on.

Since characteristics of a MOS device are determined by the amount of ions implanted in molecules, the initial status cannot be determined in the manufacture process. NEC has no responsibility for the output statuses of pins, input and output settings, and the contents of registers at power on. However, NEC assures operation after reset and items for mode setting if they are defined.

When you turn on a device having a reset function, be sure to reset the device first.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.

NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.

While NEC Corporation has been making continuous effort to enhance the reliability of its semiconductor devices, the possibility of defects cannot be eliminated entirely. To minimize risks of damage or injury to persons or property arising from a defect in an NEC semiconductor device, customer must incorporate sufficient safety measures in its design, such as redundancy, fire-containment, and anti-failure features.

NEC devices are classified into the following three quality grades:

"Standard", "Special", and "Specific". The Specific quality grade applies only to devices developed based on a customer designated "quality assurance program" for a specific application. The recommended applications of a device depend on its quality grade, as indicated below. Customers must check the quality grade of each device before using it in a particular application.

Standard: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots

Special: Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support)

Specific: Aircrafts, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems or medical equipment for life support, etc.

The quality grade of NEC devices in "Standard" unless otherwise specified in NEC's Data Sheets or Data Books. If customers intend to use NEC devices for applications other than those specified for Standard quality grade, they should contact NEC Sales Representative in advance.

Anti-radioactive design is not implemented in this product.
