

## Features

- AC'97 2.2 compliant codec
- 20-bit, stereo ADC and 6-channel stereo DACs
- 1 Hz resolution VSR on all channels
- Integrated IEC958 line driver for S/PDIF output
- S/PDIF compressed digital or LPCM audio out
- Hardware downmix option to 2 channels
- ADC DC removal for removing recording white noise
- 4-bit 3D stereo expansion for simulated surround
- 4 stereo, 2 mono analog line-level inputs
- Second line-level output with volume control
- External Audio Amplifier Control
- Low Power consumption mode
- Exceeds Microsoft® WHQL logo requirements
- 3.3V digital, 3.3 or 5V analog power supply
- 48-pin LQFP small footprint package

## Description

VIA Technologies' VT1616™ 20-bit  $\Sigma\Delta$  audio codec conforms to the AC'97 2.2 and S/PDIF Output specifications. The VT1616 integrates Sample Rate Converters on all channels and can be adjusted in 1Hz increments. There is a provision in hardware for down-mixing the 6 channels into stereo when only two end points are available. The analog mixer circuitry integrates a stereo enhancement to provide a pleasing 3D surround sound effect for stereo media. This codec is designed with aggressive power management to achieve low power consumption. When used with a 3.3V analog supply, power consumption is further reduced. The primary applications for this part are desktop and portable personal computers multimedia subsystems. However, it is suitable for any system requiring 6-channel audio output for home theater systems at competitive prices.

31	NC	–	No Connect
32	CAP2	–	ADC Reference Voltage Capacitor
33	NC	–	No Connect
34	NC	–	No Connect
35	LINE_OUT_L	O	Line Out Left Channel
36	LINE_OUT_R	O	Line Out Right Channel

**Table 1. Pin Description (continued...)**

Pin #	Symbol	Type	Description
37	MONO_OUT	O	Mono Output
38	AVCC2	P	Analog Supply Voltage, 5V or 3.3V
39	LNL/SR_OUT_L	O	Alternate Left Line Level out or Rear Channel Left
40	NC	–	No Connect
41	LNL/SR_OUT_R	O	Alternate Right Line Level out or Rear Channel Right
42	AGND2	P	Analog Ground
43	CENTER_OUT	O	Center Channel Output
44	LFE_OUT	O	Low Frequency Effects Output
45	ID0	I	Multiple Codec Select (Internal pull-up). <i>Please see Table 5.</i>
46	ID1	I	Multiple Codec Select (Internal pull-up). <i>Please see Table 5.</i>
47	EAPD	O	External Power Amplifier Power Down
48	SPDIF_OUT	I/O	PCM/Non-Audio Sony/Philips Digital I/F Output (Internal pull-up). If left floating, S/PDIF not implemented reported on 2Ah, bit 2 = “0”

**Note:** The VT1616 supports +5V or +3.3V analog power supply. For best analog performance use a 5V analog supply. For maximum power savings use 3.3V for both analog and digital sections. You must use 3.3V as the digital supply. The digital I/Os are **NOT** 5V tolerant.

**Figure 3. Typical Connection Diagram**

In compliance with the AC '97 rev. 2.2 specification, all reserved or non-implemented register bits, non-implemented addresses, odd register addresses return 0 when read. Vendor specific registers 5Ah - 7Ah are reserved for special functions, testing and similar operations.

## Register Descriptions

### Reset Register (Index 00h)

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
–	SE4	SE3	SE2	SE1	SE0	ID9	ID8	ID7	ID6	ID5	ID4	ID3	ID2	ID1	ID0	6D50h

The Reset register is used to configure the hardware to a known state or to read the ID code of the part. A code was assigned to VIA Technologies (27 = 11011h) for 3D Stereo Enhancement reflected in SE[4:0]. ID8 and ID6 are set to 1b to report that the ADC and DAC are 20-bit resolution respectively. The VT1616 supports an alternate line level out with independent volume control as reflected by ID4=1b. However, since pins 39 and 41 are shared with the Surround DAC outputs, register 5Ah, bit 15, LVL has to be set to “1”. Writing data to this register will set all the mixer registers to their default values. For description of the bits set to 0b, refer to AC’97 Rev. 2.2 spec.

### Stereo Output Control Register (Index 02h)

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
Mute	–	–	ML4	ML3	ML2	ML1	ML0	–	–	–	MR4	MR3	MR2	MR1	MR0	8000h

#### Mute                      Stereo Output Mute Control

“1” : Mute enabled

“0” : Mute disabled

#### ML[4:0]                  Master Output (Left Channel) Volume Control

These five bits select the level of attenuation applied to the Left channel of the Stereo Output signal. The level of attenuation is programmable from 0dB to -46.5dB in 1.5dB increments, providing a total of 32 programmable levels. Please refer to **Table 2** on page 10 for details.

#### MR[4:0]                  Master Output (Right Channel) Volume Control

These five bits select the level of attenuation applied to the Right channel of the Stereo Output signal. The level of attenuation is programmable from 0dB to -46.5dB in 1.5dB increments, providing a total of 32 programmable levels. Please refer to **Table 2** on page 10 for details.

**Alternate Line Output Control Register (Index 04h)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
Mute	–	–	ML4	ML3	ML2	ML1	ML0	–	–	–	MR4	MR3	MR2	MR1	MR0	8000h

**Note:** Pins 39 and 41 are shared with the Surround DAC outputs. LVL, register 5Ah, bit 15, has to be set to “1”

**Mute                      Stereo Output Mute Control**

“1” : Mute enabled

“0” : Mute disabled

**ML[4:0]                    Alternate Line Output (Left Channel) Volume Control**

These six bits select the level of attenuation applied to the Left channel of the Stereo Output signal. The level of attenuation is programmable from 0dB to -46.5dB in 1.5dB increments, providing a total of 32 programmable levels. Please refer to **Table 2** on page 10 for details.

**MR[4:0]                    Alternate Line Output (Right Channel) Volume Control**

These five bits select the level of attenuation applied to the Right channel of the Stereo Output signal. The level of attenuation is programmable from 0dB to -46.5dB in 1.5dB increments, providing a total of 32 programmable levels. Please refer to **Table 2** on page 10 for details.

**Mono Output Control Register (Index 06h)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
Mute	–	–	–	–	–	–	–	–	–	–	MM4	MM3	MM2	MM1	MM0	8000h

**Mute Mono Output Mute Control**

“1” : Mute enabled

“0” : Mute disabled

**MM[4:0] Mono Output Volume Control**

These five bits select the level of attenuation applied to the Mono Output signal. The level of attenuation is programmable from 0dB to -46.5dB in 1.5dB increments, providing a total of 32 programmable levels. Please refer to **Table 2** on page 10 for details.

**Table 2. Stereo and Mono Output Attenuation**

	M4	M3	M2	M1	M0	Level (dB)
0	0	0	0	0	0	0.0
1	0	0	0	0	1	-1.5
2	0	0	0	1	0	-3.0
3	0	0	0	1	1	-4.5
4	0	0	1	0	0	-6.0
5	0	0	1	0	1	-7.5
..	..	..	..	..	..	..
..	..	..	..	..	..	..
28	1	1	1	0	0	-42.0
29	1	1	1	0	1	-43.5
30	1	1	1	1	0	-45.0
31	1	1	1	1	1	-46.5

**PC Beep Input Volume Control Register (Index 0Ah)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
Mute	–	–	–	–	–	–	–	–	–	–	PV3	PV2	PV1	PV0	–	8000h

**Mute PC Beep Input Mute Control**

“1” : Mute enabled

“0” : Mute disabled

**PV[3:0] PC Beep Input Volume Control**

These four bits select the level of attenuation applied to the PC beep input signal. The level of attenuation is programmable from 0dB to -45dB in 3dB increments, providing a total of 16 programmable levels. The beep gain is set at 0dB when PV[3:0] = 0h. Even though the default of the input volume control is mute, as long as RESET# is active, PC Beep will be passively routed to the line outputs.

**Phone Input Volume Control Register (Index 0Ch)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
Mute	–	–	–	–	–	–	–	–	–	–	GN4	GN3	GN2	GN1	GN0	8008h

**Mute Phone Input Mute Control**

“1” : Mute enabled

“0” : Mute disabled

**GN[4:0] Phone Input Volume Control**

These five bits select the gain applied to the Phone Input signal. The gain is programmable from -34.5dB to 12dB in 1.5dB increments, providing a total of 32 programmable levels. Please refer to **Table 3** on page 14 for details.

**Mic Input Volume Control Register (Index 0Eh)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
Mute	–	–	–	–	–	–	–	–	20dB	–	GN4	GN3	GN2	GN1	GN0	8008h

**Mute Mic Input Mute Control**

“1” : Mute enabled

“0” : Mute disabled

**20dB Mic Boost Control**

“1” : Fixed 20dB gain enabled

“0” : Fixed 20dB gain disabled

**GN[4:0] Mic Input Volume Control**

These five bits select the gain applied to the Mic Input signal. The gain is programmable from -34.5dB to 12dB in 1.5dB increments, providing a total of 32 programmable levels. Please refer to **Table 3** on page 14 for details.

**Line Input Control Register (Index 10h)**

**Record Select Register (Index 1Ah)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
-	-	-	-	-	SL2	SL1	SL0	-	-	-	-	-	SR2	SR1	SR0	0000h

**SL[2:0]**
**Record Source Select (Left Channel)**

These bits determine the record source for the left channel.

SL2	SL1	SL0	Left Record Source
0	0	0	Mic
0	0	1	CD (L)
0	1	0	Video In (L)
0	1	1	Aux In (L)
1	0	0	Line In (L)
1	0	1	Stereo Mix (L)
1	1	0	Mono Mix
1	1	1	Phone

**SR[2:0]**
**Record Source Select (Right Channel)**

These bits determine the record source for the right channel.

SR2	SR1	SR0	Right Record Source
0	0	0	Mic
0	0	1	CD (R)
0	1	0	Video In (R)
0	1	1	Aux In (R)
1	0	0	Line In (R)
1	0	1	Stereo Mix (R)
1	1	0	Mono Mix
1	1	1	Phone

**Record Gain Control Register (Index 1Ch)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
Mute	–	–	–	GL3	GL2	GL1	GL0	–	–	–	–	GR3	GR2	GR1	GR0	8000h

**Mute**                      **Record Mute Control**  
 “1” : Mute enabled  
 “0” : Mute disabled

**GL[3:0]**                    **Record Gain Control (Left Channel)**  
 These four bits select the gain applied to the LEFT channel recording source. The gain is programmable from 0dB to 22.5dB in 1.5dB increments, providing a total of 16 programmable levels. The gain is set at 0dB when GL[3:0] = 0h.

**GR[3:0]**                    **Record Gain Control (Right Channel)**  
 These four bits select the gain applied to the RIGHT channel recording source. The gain is programmable from 0dB to 22.5dB in 1.5dB increments, providing a total of 16 programmable levels. The gain is set at 0dB when GR[3:0] = 0h.

**General Purpose Register (Index 20h)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
–	–	3D	–	–	–	MIX	MS	LPBK	–	–	–	–	–	–	–	0000h

**3D**                            **3D Stereo Enhancement**  
 “1” : Enable 3D  
 “0” : Disable 3D

**MIX**                        **Mono Output Mode**  
 “1” : Mic Output  
 “0” : Mono mix output

**MS**                         **Microphone Select**  
 “1” : Microphone 2  
 “0” : Microphone 1

**LPBK**                      **Loopback Mode**  
 For this bit to be valid, 5C\_0 must be set to “1”. See description of LBE on page 26.  
 “1” : DAC/ADC Loopback enabled  
 “0” : DAC/ADC Loopback disabled

**3D Control Register (Index 22h)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
-	-	-	-	-	-	-	-	-	-	-	-	DP3	DP2	DP1	DP0	0000h

**DP[3:0]**
**3D Depth Control**

These four bits control the linear depth control of the 3D stereo enhancement built into the codec. The gain is programmable from 0% to 100% in 6.67% increments, providing a total of 16 programmable levels. The default value corresponds to no stereo enhancement.

**Table 4. 3D Depth Control**

	DP3	DP2	DP1	DP0	Level (%)
0	0	0	0	0	0.0
1	0	0	0	1	6.67
2	0	0	1	0	13.33
3	0	0	1	1	20
4	0	1	0	0	26.67
5	0	1	0	1	33.33
..	..	..	..	..	..
..	..	..	..	..	..
12	1	1	0	0	80
13	1	1	0	1	86.67
14	1	1	1	0	93.33
15	1	1	1	1	100

**Power Down and Status Register (Index 26h)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
EAPD	PR6	PR5	PR4	PR3	PR2	PR1	PR0	–	–	–	–	REF	ANL	DAC	ADC	0000h

**EAPD**
**Enable Amplifier Power Down**

“1” : Powerdown External Power Amplifier

“0” : External Power Amplifier active

The signal polarity at pin 47, EAPD is identical to bit description.

**PR[6:0]**
**Power Down Mode Bits**

These read/write bits are used to control the power down states of the VT1616. Each power down function bit is enabled by setting the respective bit high. Particularly, PR5 has no effect unless PR0, PR1 and PR4 are all set to “1”. This implies that the codec can be woken up by a warm reset, because warm reset clears PR4, which in turn disables the function of PR5. The register bit, however will not be cleared by a warm reset. The power down modes controlled by each bit is described in the table below:

Bit	Function
PR0	ADC and Mux Powerdown
PR1	DAC Powerdown
PR2	Mixer Powerdown (VREF on)
PR3	Mixer Powerdown (VREF off)
PR4	AC Link Powerdown (BIT_CLK off)
PR5	Internal Clock Disabled
PR6	Alternate Line Out Powerdown

**REF,ANL,ADC,DACStatus (READ Only) bits**

These bits are used to monitor the readiness of some sections of the VT1616. Reading a “1” from any of these bits would be an indication of a “ready” state.

Bit	Status Bit
REF	VREF at nominal level
ANL	Mixer, Mux and Volume Controls ready
DAC	DAC ready to accept data
ADC	ADC ready to transmit data

**Extended Audio ID Register (Index 28h)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
ID1	ID0	–	–	–	–	AMAP	LDAC	SDAC	CDAC	–	–	–	SPDIF	–	VRA	01Exh

The Extended Audio ID is a read only register that indicates the capabilities of the VT1616.

**ID[1:0]** (See Table below)

One primary and an additional codec may be supported as an option. Since the VT1616 codec has all six outputs implemented, the ID pin setting affects only the BIT\_CLK direction and the register decoding. BIT\_CLK output the power-up default. Setting the codec besides default changes BIT\_CLK to input mode. As indicated by D9, AMAP=0, there is no need to change slot mappings.

**Table 5. Multiple Codec Mode Status Bits**

ID1	ID0	Codec Mode
0	0	Primary Codec (default)
0	1	Secondary Codec
1	0	Invalid
1	1	Invalid

**Note:** The state of the ID pins is reported in reverse polarity on register 28h, bits D15 and D14. If you use this table to configure the codec via pins 45 and 46, use the inverse values. Please, refer to **Figure 4** on page 27. BIT\_CLK is an output for the primary codec and an input pin for the controller and secondary codecs. ID[1:0] pins with internal pull-up resistors defaults codec as primary codec.

**AMAP** **Slot/DAC mapping based on Codec ID**  
 “0” : Feature not applicable since all possible channels are available on VT1616.

**xDAC** **Multi-channel Output Capabilities**  
 “1” : LDAC, SDAC, CDAC report to the querying host that the codec has all six outputs implemented.

**SPDIF** **Sony/Philips Digital Audio Interface**  
 “1” : Feature implemented in compliance to “S/PDIF Output for AC ‘97, Rev 1.0”  
 “0” : Indicates that SPDIF\_OUT pin 48 is left floating or pulled-high. It reflects the lack of external S/PDIF application circuitry.

**VRA** **Variable Sampling Rate PCM Audio**  
 “1” : Feature implemented in compliance to AC ‘97 2.2 Appendix A

**Extended Audio Status/Control Register (Index 2Ah)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
–	–	PRK	PRJ	PRI	SPCV	–	LDAC	SDAC	CDAC	SSA1	SSA0	–	SPDIF	–	VRA	3800h

**PRx Multi-channel Output Control**

All three bits, PRK, PRJ, PRI behave similarly. When set to “0”, the respective DAC(s) is (are) turned on. PRK is for LFE, PRJ for Surround (Rear pair), PRI for Center channel.

**SPCV S/PDIF Configuration Valid (Read Only)**

“0” : S/PDIF configuration (SSA, SSR, DAC rate, DRS) invalid (not supported)

“1” : S/PDIF configuration (SSA, SSR, DAC rate, DRS) valid (supported)

**xDAC Multi-channel Output Status (Read Only)**

These read only bits, LDAC, SDAC, CDAC behave similarly. When they report “1”, the respective DAC(s), LFE, Surround and Center is (are) ready.

**SSA[1:0] S/PDIF Slot Assignment**

These bits determine the S/PDIF data source from AC-link slot selection when SPDIF\_OUT, pin 48 is low during reset (pulled low by external application circuit). If the S/PDIF application circuit is not implemented, these bits will return only 0. The default state reflects the pervasive design feature of common AC’97 digital controllers supporting slots 3 & 4. Slots 10 & 11 are expected to be used in the future to support concurrent 6 channels analog and 2 channel digital audio (compressed or LPCM).

SSA1	SSA0	S/PDIF Source Data
0	0	AC-link slots 3 & 4 (front stereo pair, power-up default)
0	1	AC-link slots 7 & 8 (surround pair)
1	0	AC-link slots 6 & 9 (LFE & Center pair)
1	1	AC-link slots 10 & 11

**SPDIF Sony/Philips Digital Audio Interface Enable/Disable**

“1” : Set this bit to turn on the S/PDIF transmitter.

“0” : The S/PDIF transmitter is off by default.

**VRA Variable Sampling Rate Mode control**

“1” : Enable VSR

“0” : Fixed 48 KHz sampling rate

**PCM Front and Center DAC Sample Rate Register (Index 2Ch)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
SR15	SR14	SR13	SR12	SR11	SR10	SR9	SR8	SR7	SR6	SR5	SR4	SR3	SR2	SR1	SR0	BB80h

**SR[15:0] Main stereo + Center or all DAC Sample Rate (in Hz)**

16-bit unsigned value representing the sample rate in 1Hz resolution. The default value is 48 KHz (48000 = BB80h). This register controls all six DAC output rate providing a sample accurate synchronization among the channels. Registers 2Eh and 30h are read/writable but have no control over the Surround and LFE channels. They reflect 2Ch when read back.

**PCM Surround DAC Sample Rate Register (Index 2Eh)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
SR15	SR14	SR13	SR12	SR11	SR10	SR9	SR8	SR7	SR6	SR5	SR4	SR3	SR2	SR1	SR0	BB80h

**SR[15:0] Surround DAC Sample Rate (in Hz)**

16-bit unsigned alias value of 2Ch representing the sample rate in 1Hz resolution. The default value is 48 KHz (48000 = BB80h). This register has no physical control over the Surround pair DACs sampling rate.

**PCM LFE DAC Sample Rate Register (Index 30h)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
SR15	SR14	SR13	SR12	SR11	SR10	SR9	SR8	SR7	SR6	SR5	SR4	SR3	SR2	SR1	SR0	BB80h

**SR[15:0] LFE DAC Sample Rate (in Hz)**

16-bit unsigned alias value of 2Ch representing the sample rate in 1Hz resolution. The default value is 48 KHz (48000 = BB80h). This register has no physical control over the LFE DAC's sampling rate.

**PCM ADC Sample Rate Register (Index 32h)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
SR15	SR14	SR13	SR12	SR11	SR10	SR9	SR8	SR7	SR6	SR5	SR4	SR3	SR2	SR1	SR0	BB80h

**SR[15:0] ADC Sample Rate (in Hz)**

16-bit unsigned value representing the sample rate in 1Hz resolution. The default value is 48 KHz (48000 = BB80h).

**LFE and Center Channels Output Volume Control Register (Index 36h)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
Mute	–	–	LFE4	LFE3	LFE2	LFE1	LFE0	Mute	–	–	CNT4	CNT3	CNT2	CNT1	CNT0	8080h

**Mute Individual Output Mute Control**

“1” : Mute enabled

“0” : Mute disabled

**LFE[4:0] LFE Output Volume Control**

These five bits select the level of attenuation applied to the Low Frequency Effect channel. The level of attenuation is programmable from 0dB to -46.5dB in 1.5dB increments, providing a total of 32 programmable levels. Please refer to **Table 2** on page 10 for details.

**CNT[4:0] Center Channel Output Volume Control**

These five bits select the level of attenuation applied to the Center channel. The level of attenuation is programmable from 0dB to -46.5dB in 1.5dB increments, providing a total of 32 programmable levels. Please refer to **Table 2** on page 10 for details.

**Surround Channels Output Volume Control Register (Index 38h)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
Mute	–	–	LSR4	LSR3	LSR2	LSR1	LSR0	Mute	–	–	RSR4	RSR3	RSR2	RSR1	RSR0	8080h

**Note:** Pins 39 and 41 are shared with the Alternate Line Level Out, main stereo DAC outputs. LVL, register 5Ah, bit 15, has to be set to “0” for this register to be effective on the same volume control block.

**Mute Individual Output Mute Control**

“1” : Mute enabled

“0” : Mute disabled

**LSR[4:0] Left Surround (Rear) Channel Output Volume Control**

These five bits select the level of attenuation applied to the Left Surround channel. The level of attenuation is programmable from 0dB to -46.5dB in 1.5dB increments, providing a total of 32 programmable levels. Please refer to **Table 2** on page 10 for details.

**RSR[4:0] Right Surround (Rear) Channel Output Volume Control**

These five bits select the level of attenuation applied to the Right Surround channel. The level of attenuation is programmable from 0dB to -46.5dB in 1.5dB increments, providing a total of 32 programmable levels. Please refer to **Table 2** on page 10 for details.

**S/PDIF Control Register (Index 3Ah)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
V	–	SSR1	SSR0	L	CC6	CC5	CC4	CC3	CC2	CC1	CC0	PRE	COPY	/PCM	PRO	x000h

This read/write register controls the S/PDIF functionality when SPDIF bit at 28h\_2 reports S/PDIF is implemented. It will return 0000h when SPDIF\_OUT, pin 48 left floating or pulled high. If S/PDIF is implemented for the final product, it will read 2000h at power-up. The register manages the bit fields propagated as channel status (or subframe in the V case). With the exception of V, this register should only be written when the S/PDIF transmitter is disabled (SPDIF bit at 2Ah\_2 is “0”). This ensures that control and status information start up correctly at the beginning of S/PDIF transmission.

**V Validity**

This bit affects the “Validity flag”, bit 28 transmitted in each subframe and enables the S/PDIF transmitter to maintain connection during error or mute conditions.

“0” : If a valid Left/Right pair was received via AC-link and transmitted through S/PDIF, the Validity bit should be reset to “0”

“1” : Tags both samples as invalid by setting bit 28, “Validity flag” to “1”

**SSR[1:0] S/PDIF Sample Rate**

These bits declare the available S/PDIF transmitter clock rate (64\*fs).

SSR1	SSR0	S/PDIF Sample Rate
0	0	Not Available
0	1	Reserved
1	0	48 KHz (default)
1	1	Not Available

**L Generation Level**

Programmed according to IEC standards.

**CC[6:0] Category Code**

Programmed according to IEC standards.

**PRE Preemphasis**

“1” : Indicates filter preemphasis is 50/15µs.

“0” : Default is no Preemphasis.

**COPY Copyright**

“1” : Indicates copyright is asserted.

“0” : Copyright is not asserted (default).

**/PCM Non-Audio Samples**

“1” : Set this bit for transmitting non-PCM audio samples such as AC-3.

“0” : Indicates samples are linear PCM suitable for direct conversion to audio playback. .

**PRO Professional**

“1” : Set Professional mode. Set this bit in conjunction with /PCM bit (above) for AC-3.

“0” : Indicates Consumer mode (default).

**Vendor Reserved Register (Index 5Ah)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
LVL	Res.	Res.	LCTF	STF	BPDC	DC	Res.	Res.	Res.	Res.	Res.	IB1	IB0	Res.	Res.	8200h

**Res. Test Mode Bits**  
 These read/write bits are used for testing the digital modes of the audio codec. Do not access them during Normal operation.

**LVL Alternate Line Level Out to Surround Out**  
 The VT1616 powers up with pins 39 and 41 assigned to the Front channel DACs as described in the AC97 Revision 2.2 specification. When this bit is to “0”, the output pins get assigned to the Rear stereo DAC pair with an independent volume control.

**LCTF Downmix LFE and Center DAC outputs to the Front channels**  
 The VT1616 is capable of downmixing the LFE and the Center channel outputs to the Line\_Out pins using internal hardware. Without processing overhead, it is possible to listen to all the channels without loss of audio cues. The relative SPL (Sound Pressure Level) for these channels are retained as meant by the digital audio content mastering engineer. This is ideal for 4-channel applications.

**STF Downmix Surround DAC outputs to the Front channels**  
 The VT1616 is capable of downmixing the Rear channel outputs to the Line\_Out pins using internal hardware besides the LFE and the Center. This is useful when multichannel material needs to be played back on a stereo end point like headphones. Without processing overhead, it is possible to listen to all the channels without loss of audio cues. The relative SPL (Sound Pressure Level) for these channels are retained as meant by the digital audio content mastering engineer. This is ideal for 2-channel applications when LCTF and STF are both activated at the same time.

**BPDC ADC DC-offset Removal Control**  
 The default setting of “0” ensures that the circuit is disabled at power up. When set to “1”, the DC-offset cancellation circuit will be enabled. This helps to maximize recording quality by removing white noise.

**DC DC-offset Removal Capability**  
 This read only bit indicates that the codec incorporates DC-offset removal hardware.

**IB[1:0] Analog Current Setting Bits**  
 Normally these bits should be left at default when analog operating at 5V supply. The four possible settings adjust the power consumption of the analog section. The power-up default 00b sets the codec for the best overall analog performance at 5V. At 3.3V analog supply, 10b should be set for the lowest power instead of default 00b. This mode is desirable for system designs with limited power budget such as battery operated portable devices. Setting to 11b puts the codec to its best A-A mixer performance overall.

IB1	IB0	Analog Current Setting
0	0	Normal (1X)
0	1	Reduced (4/5X)
1	0	Power Miser (2/3X)
1	1	Enhanced (4/3X)

**Vendor Reserved Register (Index 5Ch)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	Res.	LBE	0000h

**LBE**                    **Loopback Test Mode Engage**  
 When set to “1”, it will allow the functionality of 20h\_7, Loopback test mode.

**Res.**                    **Test Mode Bits**  
 These read/write bits are used for testing the digital modes of the audio codec. Do not access them during Normal operation.

**Vendor Identification Register (Index 7Ch)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
F7	F6	F5	F4	F3	F2	F1	F0	S7	S6	S5	S4	S3	S2	S1	S0	4943h

The upper and lower byte of this register (index 7Ch), in conjunction with the upper byte of index register 7Eh, make up the vendor identification code for the VT1616. The Vendor ID Code (in ASCII format) is equal to “ICE”, where:

**F[7:0]**                    **Upper Byte (Index 7Ch) D[15:8] = I**

**S[7:0]**                    **Lower Byte (Index 7Ch) D[7:0] = C**

**T[15:8]**                    **Upper Byte (Index 7Eh) D[15:8] = E**

**Revision Identification Register (Index 7Eh)**

D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	Default
T7	T6	T5	T4	T3	T2	T1	T0	REV7	REV6	REV5	REV4	REV3	REV2	REV1	REV0	4551h

The upper byte of this register is used in conjunction with index register 7Ch to make up the Vendor ID code for the VT1616. The lower byte identifies VT1616 and its revision code.

**T[15:8]**                    **See description in Vendor Identification Register.**

**REV[7:0]**                    **Revision ID**  
 “51”: VT1616 identification and revision number

**Note:** As a reference, other valid Rev IDs associated with VIA AC’97 products are: “01h” for the VT1611 (ICE1230), “11h” for the VT1611A (ICE1232), and “14h” for the ICE1232A (this part has no corresponding VIA part number).

### Multiple Codec Example

The primary codec provides the master BIT\_CLK. The secondary codec, if any, and the controller, will use this clock to work in synchronous mode. Note that the ID[1:0] pins are internally pulled up; therefore, it is necessary to pull the ID[1:0] pins low to set the codec as secondary. Notice that the state of the ID[1:0] pins are reflected in reverse polarity as shown on **Table 5** on page 19. See Reg. 28h for more details.

**Figure 4. Multiple Codec Example**

## Power Management

The VT1616 may be placed in several power down states using the power down control bits located in index register 26h. **Table 6** lists the power down states accessible through this register.

**Table 6. Power Down Mode Bits**

Bit	Function
PR0	ADC and Mux Powerdown
PR1	DAC Powerdown
PR2	Mixer Powerdown (VREF on)
PR3	Mixer Powerdown (VREF off)
PR4	AC Link Powerdown (BIT_CLK off)
PR5	Internal Clock Disabled
PR6	Alternate Line Out Powerdown

**Note:** Registers maintain values in sleep mode (PR4 write) and wake up with a warm reset (register values) or a cold reset (default values). Power Down and Status register (index 26h) read action verifies stability before power down write action occurs.

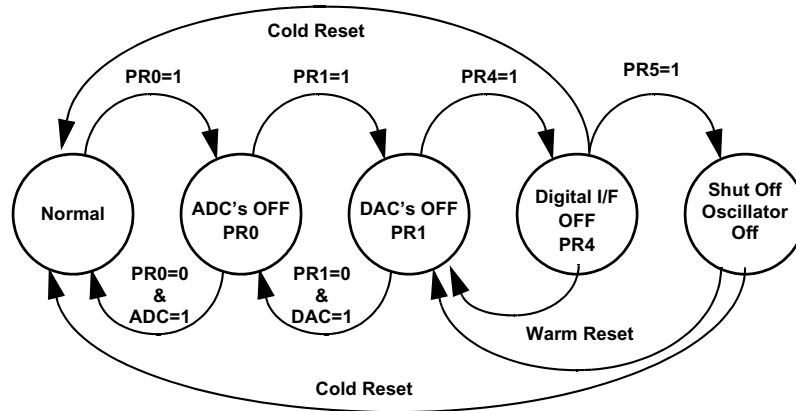

Note: In this example, the Analog Mixer has been disabled, but VREF is still on.

**Figure 5. AC'97 Power Down / Power Up Procedure**

Complete power down of the AC'97 device is achieved by sequential writes to the Power Down and Status Control Register (Index 26h) as follows:

Normal Operations:	PR[6:0] = 00h
ADC's and Input Mux:	PR0 = 1 (write)
DAC's:	PR1 = 1 (write)
Analog Mixer:	PR2 = 1 (write)
VREF_OUT:	PR3 = 1 (write)
AC-link:	PR4 = 1 (write)
Internal Clocks:	PR5 = 1 (write)
Alt. Line Out:	PR6 = 1 (write)

**Power Management (continued...)**

Note: To wake up the codec, a warm reset can be used; PR4 is reset to zero upon either reset. PR5 can only be cleared by a cold reset.

**Figure 6. AC'97 Power Down Procedure with Analog Section Still Active**

**Test Mode Operation**

**ATE Test Mode: (PCB in-circuit Testing of the VT1616)**

ATE Test mode is entered when the SDATA\_OUT signal is sampled at the rising edge of the RESET# signal. In this mode, the SDATA\_IN and BIT\_CLK pins are placed in a high impedance (Hi-Z) state as shown on **Table 14** on page 39. This mode of operation doesn't occur under normal operating conditions.

**Vendor Test Mode:**

Vendor Test mode is entered when the SYNC signal is sampled during the rising edge of the RESET# signal as shown on **Table 15** on page 39. This mode of operation doesn't occur under normal operating conditions.

## Absolute Maximum Ratings

**Table 7. Limits**

(AGND = DGND = 0V)

Symbol	Parameter	Min	Typ	Max	Unit
–	Digital Power Supplies (DVCC)	-0.3		4.0	V
–	Analog Power Supplies (AVCC)	-0.3		6.0	V
–	Input Current per Pin	-10		10	mA
–	Output Current per Pin	-15		15	mA
–	Digital Input Voltage	-0.3		DVCC+0.3	V
–	Analog Input Voltage	-0.3		AVCC+0.3	V
–	Total Power Dissipation		270		mW
–	Ambient Temperature	-55		110	°C
–	Storage Temperature	-65		150	°C

**Caution:** Exceeding any of these limits can cause permanent failure of the device and will void any claims against product quality.

## Recommended Operating Conditions

**Table 8. Limits**

(AGND = DGND = 0V)

Symbol	Parameter	Min	Typ	Max	Unit
–	Digital Power Supplies (DVCC)	3.135	3.3	3.465	V
–	Analog Power Supplies (AVCC), preferred	4.75	5	5.25	V
–	Analog Power Supplies (AVCC), for low power apps	3.135	3.3	3.465	V
–	Operating Ambient Temperature	0		70	°C

## Performance Specifications

**Table 9. Analog Performance Characteristics (+5V Power)**

TA=25°C, AVCC = 5V ± 5%, DVCC = 3.3V ± 5%; AGND = DGND = 0V; 10kΩ / 50pF Load; FS = 48 KHz, 0dB = 1VRMS; BW: 20Hz ~ 20 KHz, 0dB Attenuation, IB[1:0]=00 (power up default), as targeted for a 2-layers VT5542 ACR card

Symbol	Parameter	Min	Typ	Max	Unit
	Full Scale Input Voltage: Line Inputs		1.0		VRMS
	Mic Inputs (20dB = 0)		1.0		VRMS
	Mic Inputs (20dB = 1)		0.1		VRMS
	Full Scale Output Voltage: Line Outputs		1.0		VRMS
	Mono Output		1.0		VRMS
	Analog S/N: CD to LINE_OUT		96		dB
	Other to LINE_OUT		96		dB
	Analog Frequency Response	20		20,000	Hz
	Digital S/N: DACs	85	88		dB
	ADC	75	91		dB
	Total Harmonic Distortion: LINE_IN to LINE_OUT		-94	-74	dB
	(DA) DAC to LINE_OUT		-82	-74	dB
	D/A and A/D Frequency Response: DACs	20		19,200	Hz
	ADC	20		19,200	Hz
	Transition Band: DACs	19,200		28,800	Hz
	ADC	19,200		28,800	Hz
	Stop Band: DACs	28,800		infinity	Hz
	ADC	28,800		infinity	Hz
	Stop Band Rejection: DACs	75			dB
	ADC	75			dB
	Out-of-Band Rejection		-40		dB
	Group Delay			1	ms
	Power Supply Rejection Ratio (1 KHz)		-40		dB
	Input Channel Crosstalk			-70	dB
	Spurious Tone Reduction		-100		dB
	Attenuation, Gain Step Size		1.5		dB
	Input Impedance	10	45		kΩ
	Input Capacitance		15		pF
	VREFOUT		2.4		V

**Note:** V<sub>IL</sub> = 0.8V, V<sub>IH</sub> = 2.4V

Analog Frequency Response has ±1dB limits

SNR (measured as THD+N) of rms output level with 1 KHz full-scale input to rms output level with all zeros into digital input

Measured "A wtd" over a 20Hz ~ 20 KHz bandwidth (AES17-1991 Idle Channel Noise or EIAJ CP-307 SNR)

THD: 0dB gain, 20 KHz BW, Fs = 48 KHz, -3dB "large" signal

A/D and D/A Frequency Response has ±0.25dB limits

Stop Band Rejection determines filter requirements

Out-of-Band rejection determines audible noise

Integrated Out-of-band noise generated by DAC during normal PCM audio playback over: BW = 28.8 KHz~100 KHz, with respect to 1 VRMS DAC output

**Performance Specifications (continued...)**
**Table 10. Analog Performance Characteristics (+3.3V Power)**

TA=25°C, AVCC = DVCC = 3.3V ± 5%; AGND = DGND = 0V; 10kΩ / 50pF Load; FS = 48 KHz, 0dB = 0.70VRMS;

BW: 20Hz ~ 20 KHz, 0dB Attenuation, IB[1:0]=10 (set by software), as targeted for a 2-layers VT5542 ACR card

Symbol	Parameter	Min	Typ	Max	Unit
	Full Scale Input Voltage: Line Inputs		0.7		VRMS
