

## LOW VOLTAGE COMPANDER—YD5020

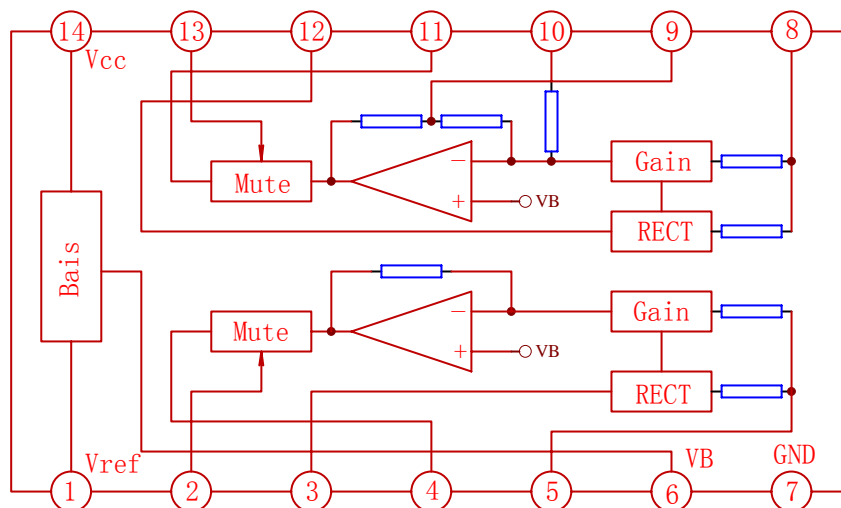

### DESCRIPTION

The YD5020 contains two variable gain circuits configured for compressing and expanding the dynamic range of an audio signal. One circuit is configured as an expander, while the other circuit can be configured as a compressor or expander. Each circuit has a full wave rectifier to provide average value information to a variable gain cell located in either the input stage or the feedback path.

### FEATURES

- \*Low voltage operation:  $V_{opr}=1.8\sim 5.0V$
- \*Decreasing external component
- \*Built in compressor and expander mute circuit
- \*Unity gain level set a  $100mV_{rms}$
- \*Response time adjustable
